Sensory Processing In The Brain:

Sensory Processing in the Mammalian Brain Gerhard Werner, University of Pittsburgh. Center for Neuroscience, 1989 The essays in this edited volume are written by neuroscientists distinguished for their research into the neurobiology of mammalian sensory processing Covering a wide range of current experimental approaches to the investigation of the mammalian brain the contributors address the nature of the central neural representation of the major sensory systems taste smell hearing sight pain and touch Comparisons of their experimental rationales methods of approach and of the resulting data demonstrate the commonality of many features of neural organization between the different sensory systems explored Among the features discussed in detail are the import of elaborately structured maps of sensory function in the cerebral cortex the degree of anatomical and physiological separation of different aspects of the input within single sensory systems the nature of neuron assemblies responsible for complex analytic events and the relation between metabolic patterns of activity and physiological recording of response properties The importance of theoretical models new imaging techniques and investigations using neural transplants for experimental analysis of sensory systems are demonstrated and the influence of the concepts of cognitive psychology on experimental investigations of sensory processing is discussed A series of commentaries links the book's different sections indicating for the reader those aspects of the experimental findings that are of particular importance to an understanding of the field as a whole

Sensory Processing in the Brain Dean Everett Wooldridge, 1979

Multisensory Object Perception in the Primate Brain Marcus Johannes Naumer, Jochen Kaiser, 2010-07-03 It should come as no surprise to those interested in sensory processes that its research history is among the longest and richest of the many systematic efforts to understand how our bodies function The continuing obsession with sensory systems is as much a reaction of the fundamental need to understand how we experience the physical world as it is to understand how we become who we are based on those very experiences The senses function as both portal and teacher and their individual and collective properties have fascinated scientists and philosophers for millennia In this context the attention directed toward specifying their properties on a sense by sense basis that dominated sensory research in the 20th century seems a prelude to our current preoccupation with how they function in concert Nevertheless it was the concentrated effort on the operational principles of individual senses that provided the depth of understanding necessary to inform current efforts to reveal how they act cooperatively We know that the information provided by any individual sensory modality is not always veridical but is subject to a myriad of modality specific distortions Thus the brain's ability to compare across the senses and to integrate the information they provide is not only a way to examine the accuracy of any individual sensory channel but also a way to enhance the collective information they make available to the brain

The New Handbook of Multisensory Processing Barry E. Stein, 2012-06-01 The major reference work for a rapidly advancing field synthesizes central themes reports on current findings and offers a

blueprint for future research Scientists attempts to understand the physiology underlying our apprehension of the physical world was long dominated by a focus on the individual senses The 1980s saw the beginning of systematic efforts to examine interactions among different sensory modalities at the level of the single neuron And by the end of the 1990s a recognizable and multidisciplinary field of multisensory processes had emerged More recently studies involving both human and nonhuman subjects have focused on relationships among multisensory neuronal ensembles and their behavioral perceptual and cognitive correlates The New Handbook of Multisensory Processing synthesizes the central themes in this rapidly developing area reports on current findings and offers a blueprint for future research The contributions all of them written for this volume by leading experts reflect the evolution and current state of the field This handbook does more than simply review the field Each of the volume s eleven sections broadly surveys a major topic and each begins with a substantive and thought provoking commentary by the section editor that identifies the major issues being explored describes their treatment in the chapters that follow and sets these findings within the context of the existing body of knowledge Together the commentaries and chapters provide an invaluable guide to areas of general agreement unresolved issues and topics that remain to be explored in this fast moving field

Sensory Processing in Aquatic Environments Shaun P. Collin,N,Justin Marshall,2008-04-08 Research on sensory processing or the way animals see hear smell taste feel and electrically and magnetically sense their environment has advanced a great deal over the last fifteen years This book discusses the most important themes that have emerged from recent research and provides a summary of likely future directions The book starts with two sections on the detection of sensory signals over long and short ranges by aquatic animals covering the topics of navigation communication and finding food and other localized sources The next section the co evolution of signal and sense deals with how animals decide whether the source is prey predator or mate by utilizing receptors that have evolved to take full advantage of the acoustical properties of the signal Organisms living in the deep sea environment have also received a lot of recent attention so the next section deals with visual adaptations to limited light environments where sunlight is replaced by bioluminescence and the visual system has undergone changes to optimize light capture and sensitivity The last section on central co ordination of sensory systems covers how signals are processed and filtered for use by the animal This book will be essential reading for all researchers and graduate students interested in sensory systems [Sensory Processing,](#)

[Perception, and Behavior](#) Robert Burr Livingston,1978 [The Oscillating Brain](#) Timothy D. Sheehan M.D.,2016-01-12 The Oscillating Brain explains for the first time how the human brain works Neural oscillation is a form of repetitive activity which is characteristic of complex systems The brain has extensive reciprocal connections Reciprocal connectivity is the basis for neural oscillation While some patterns of neural oscillation are localized restricted to specific regions of the brain others involve reciprocal connections between geographically separate areas of the brain permitting more widespread neural network interaction Neural network oscillation transforms the brains three pound mass of grey matter into a dynamic

medium Conscious experience involves the integrated interaction of both sensory and motor areas of the brain Our experience of reality is the product of brain activity Reality as it is constructed by our brain is an inherently simplified version of the world that enables us to respond rapidly to developing situations in a fashion that promotes survival Our reality is heavily biased by our emotional reactions We see the world in terms of good and evil and continually strive for good as a means of enhancing our sense of security However differences in our experience of good and evil have been a source of human conflict for as long as mankind has been on this planet Global information networks and our increasing economic interdependence have made these differences increasingly difficult to ignore Human striving for an absolute level of certainty and security threatens our day to day existence We must learn to recognize the limitations of the human brain

The Handbook of Multisensory Processes Gemma Calvert, Charles Spence, Barry E. Stein, 2004 Research is suggesting that rather than our senses being independent perception is fundamentally a multisensory experience This handbook reviews the evidence and explores the theory of broad underlying principles that govern sensory interactions regardless of the specific senses involved
