## **Sensory Systems Of Aquatic Mammals:**

**Marine Mammal Sensory Systems** Ronald A. Kastelein, Alexander Ya. Supin, Jeanette A. Thomas, 2012-12-06 This book is a collection of original research papers given at a symposium entitled Sensory Systems and Behavior of Aquatic Mammals hosted by the USSR Academy of Sciences The meeting was held in Moscow from 16 to 25 October 1991 and involved nearly 100 scientists from around the world The major headings of the book correspond to the session topics at the symposium This meeting was not the first dedicated to problems of sensory systems in aquatic mammals Experts in this field met several times previously to discuss important problems of sensory functions in echolocating animals symposia on biosonar systems were held in Frascati Italy in 1966 then in Jersey France in 1978 and in Helsingor Denmark in 1986 Papers presented at these meetings were published in books that advanced significantly the understanding of sensory systems Busnel and Fish 1980 Nachtigall and Moore 1988 Initially echolocating bats were the main subjects of consideration However studies on echolocating aquatic mammals whales and dolphins increased from one meeting to the next Indeed aquatic mammals are of exceptional interest for studying the adaptation of sensory functions for echolocation in specific aquatic environments As a natural consequence of these developments the 1989 symposium in Rome was devoted specifically to the sensory systems of cetaceans Thomas and Kastelein 1990 This symposium was held within the Fifth International Theriological Congress and was attended by many scientists

**Sensory Systems of Aquatic Mammals** Ronald A. Kastelein, Jeanette A. Thomas, Paul E. Nachtigall, 1995 The Sensory Physiology of Aquatic Mammals Alexander Ya. Supin, Vladimir V. Popov, Alla M. Mass, 2012-12-06 This book is actually a product of efforts of many people not only of the authors Wide investigations of marine mammals began in Russia that time in the former Soviet Union in the 1960s when a few teams of enthusiasts founded in captivity experimental stations intended for keeping dolphins and seals and for performing experimental studies of these fascinating animals It was a time when attention of many people throughout the world was attracted to dolphins and other marine mammals due to appearance of oceanariums and dolphinariums which demonstrated unique capabilities of these animals So scientists in many countries concentrated on studies of them There was much to learn about the morphology physiology and psychology of marine mammals and investigators spending their time and efforts on studies in this field were rewarded by a number of surprising findings The authors of this book represent one of such research teams focused on the neuro and sensory physiology of marine mammals A few decades of studies naturally resulted in the idea to summarize in a book both the results of these studies and a large body of data in adjacent fields Our goal was to synthesize the many research findings and the present knowledge on sensory capabilities and mechanisms of sensory systems of aquatic mammals We realize however that the appearance of this book was made possible due to the help and assistance of many colleagues

**Biodiversity of Sensory Systems in Aquatic Vertebrates** Wayne Iwan Lee Davies, Shaun Collin, 2020-08-27

Sensory Biology of Aquatic Animals Jelle 1987, Richard R. Fay, William N. Tavolga, 2012-12-06 This volume constitutes a

series of invited chapters based on presentations given at an International Conference on the Sensory Biology of Aquatic Animals held June 24-28 1985 at the Mote Marine Laboratory in Sarasota Florida. The immediate purpose of the conference was to spark an exchange of ideas, concepts and techniques among investigators concerned with the different sensory modalities employed by a wide variety of animal species in extracting information from the aquatic environment. By necessity, most investigators of sensory biology are specialists in one sensory system; different stimulus modalities require different methods of stimulus control and generally different animal models. Yet it is clear that all sensory systems have principles in common such as stimulus filtering by peripheral structures, tuning of receptor cells, signal to noise ratios, adaption and disadaption and effective dynamic range. Other features such as hormonal and efferent neural control, circadian reorganization and receptor recycling are known in some and not in other senses. The conference afforded an increased awareness of new discoveries in other sensory systems that has effectively inspired a fresh look by the various participants at their own area of specialization to see whether or not similar principles apply. This inspiration was found not only in theoretical issues but equally in techniques and methods of approach. The myopia of sensory specialization was broken in one unexpected way by showing limitations of individual sense organs and their integration within each organism. For instance, studying vision, one generally chooses a visual animal as a model.

Radioactive Isotopes in Clinical Medicine and Research Xxiii Helmar Bergmann, Horst Köhn, Helmut Sinzinger, **Introduction to the Senses** Terry R. J. Bossomaier, 2012-06-14

An understanding of the senses vision, hearing, touch, chemical and other non human senses is important not only for many fields of biology but also in applied areas such as human computer interaction, robotics and computer games. Using information theory as a unifying framework, this is a wide ranging survey of sensory systems covering all known senses. The book draws on three unifying principles to examine senses: the Nyquist sampling theorem, Shannon's information theory and the creation of different streams of information to subserve different tasks. This framework is used to discuss the fascinating role of sensory adaptation in the context of environment and lifestyle. Providing a fundamental grounding in sensory perception, the book then demonstrates how this knowledge can be applied to the design of human computer interfaces and virtual environments. It is an ideal resource for both graduate and undergraduate students of biology, engineering, robotics and computer science.

Handbook of Mammalian Vocalization Stefan M Brudzynski, 2009-12-08

Handbook of Mammalian Vocalization is designed as a broad and comprehensive but well balanced book written from the neuroscience point of view in the broad sense of this term. This well illustrated Handbook pays particular attention to systematically organized details but also to the explanatory style of the text and internal cohesiveness of the content so the successive chapters gradually develop a consistent story without losing the inherent complexity. Studies from many species are included; however, rodents dominate as most of the brain investigations were done on these species. The leading idea of the Handbook is that vocalizations evolved as highly adaptive, specific signals which are selectively picked up by the brain. The brain serves as a receptor and

behavioural amplifier Brain systems will be described which allow vocal signals rapidly changing the entire state of the organism and trigger vital biological responses usually also with accompanying emission of vocalizations Integrative brain functions leading to vocal outcome will be described along with the vocalization generators and motor output to larynx and other supportive motor subsystems The last sections of the Handbook explains bioacoustic structure of vocalizations present understanding of information coding and origins of the complex semiotic semantic content of vocalizations in social mammals The Handbook is a major source of information for professionals from many fields with a neuroscience approach as a common denominator The handbook provides consistent and unified understanding of all major aspects of vocalization in a monographic manner and at the same time gives an encyclopaedic overview of major topics associated with vocalization from molecular cellular level to behavior and cognitive processing It is written in a strictly scientific way but clear enough to serve not only for specialized researchers in different fields of neuroscience but also for academic teachers of neuroscience including behavioural neuroscience affective neuroscience clinical neuroscience neuroethology biopsychology neurolinguistics speech pathology and other related fields and also for research fellows graduate and other advanced students who widely need such a source publication The first comprehensive handbook on what we know about vocalization in Mammals Carefully edited the handbook provides an integrated overview of the area International list of highly regarded contributors including Jaak Pankseep Washington State University David McFarland Oxford John D Newman NIH Unit on Developmental Neuroethology Gerd Poeppel Leipzig Shiba Keisuke Chiba City Japan and others tightly edited by a single well regarded editor who has edited a special issue in Behavioral Brain Research on the topic before

**Marine Mammals and Noise** W. John Richardson, Charles R. Greene Jr., Charles I. Malme, Denis H. Thomson, 2013-10-22 Many marine mammals communicate by emitting sounds that pass through water Such sounds can be received across great distances and can influence the behavior of these undersea creatures In the past few decades the oceans have become increasingly noisy as underwater sounds from propellers sonars and other human activities make it difficult for marine mammals to communicate This book discusses among many other topics just how well marine mammals hear how noisy the oceans have become and what effects these new sounds have on marine mammals The baseline of ambient noise the sounds produced by machines and mammals the sensitivity of marine mammal hearing and the reactions of marine mammals are also examined An essential addition to any marine biologist's library Marine Mammals and Noise will be especially appealing to marine mammalogists researchers policy makers and regulators and marine biologists and oceanographers using sound in their research

*Chemosensory Systems in Mammals,*

*Fishes, and Insects* Wolfgang Meyerhof, Sigrun Korsching, 2009-04-23 The sense of smell has an essential role in locating food detecting predators navigating and communicating social information Accordingly the olfactory system has evolved complex repertoires of receptors to face these problems Although the sense of taste has less far reaching tasks they are every bit as essential for the animals well being allowing it to reject toxic materials and to select nutritionally valuable food The last decade has seen a massive advance in understanding the molecular logic of chemosensory information processing beyond that already achieved in the first few years following Linda Buck's discovery of odorant receptors Shortly afterwards the major principles of olfactory representation had been established in mammals as the one neuron one receptor rule and the convergence of neurons which express the same receptor onto individual modules in the olfactory bulb In recent years such studies have been extended to lower vertebrates including fishes and other phyla i.e. arthropods worms and insects showing both the general validity of these concepts and some exceptions to the rule In parallel hallmarks of the molecular logic of taste sensation have been deciphered and found to differ in interesting ways from those of smell sensation
