Regression Analysis Ashish K. Sen, Muni S. Srivastava, 2013-11-11 Any method of fitting equations to data may be called regression Such equations are valuable for at least two purposes making predictions and judging the strength of relationships Because they provide a way of empirically identifying how a variable is affected by other variables regression methods have become essential in a wide range of fields including the social sciences engineering medical research and business Of the various methods of performing regression least squares is the most widely used In fact linear least squares regression is by far the most widely used of any statistical technique Although nonlinear least squares is covered in an appendix this book is mainly about linear least squares applied to fit a single equation as opposed to a system of equations The writing of this book started in 1982 Since then various drafts have been used at the University of Toronto for teaching a semester long course to juniors seniors and graduate students in a number of fields including statistics pharmacology pharmacology engineering economics forestry and the behavioral sciences Parts of the book have also been used in a quarter long course given to Master's and Ph D students in public administration urban planning and engineering at the University of Illinois at Chicago UIC This experience and the comments and criticisms from students helped forge the final version

Bioinformatics is a relatively new field of research It evolved from the requirement to process characterize and apply the information being produced by DNA sequencing technology The production of DNA sequence data continues to grow exponentially At the same time improved bioinformatics such as faster DNA sequence search methods have been combined with increasingly powerful computer systems to process this information Methods are being developed for the ever more detailed quantification of gene expression providing an insight into the function of the newly discovered genes while molecular genetic tools provide a link between these genes and heritable traits Genetic tests are now available to determine the likelihood of suffering specific ailments and can predict how plant cultivars may respond to the environment The steps in the translation of the genetic blueprint to the observed phenotype is being increasingly understood through proteome metabolome and phenome analysis all underpinned by advances in bioinformatics Bioinformatics is becoming increasingly central to the study of biology and a day at a computer can often save a year or more in the laboratory The volume is intended for graduate level biology students as well as researchers who wish to gain a better understanding of applied bioinformatics and who wish to use bioinformatics technologies to assist in their research The volume would also be of value to bioinformatics developers particularly those from a computing background who would like to understand the application of computational tools for biological research Each chapter would include a comprehensive introduction giving an overview of the fundamentals aimed at introducing graduate students and researchers from diverse backgrounds to the field and bring them up to date on the current state of knowledge To accommodate the broad range of topics in applied bioinformatics chapters have been grouped into themes gene and genome analysis molecular genetic analysis gene expression analysis protein and proteome analysis metabolome analysis phenome data analysis literature mining and bioinformatics tool development Each chapter and theme provides an introduction to the biology behind the data describes the requirements for data processing and details some of the methods applied to the data to enhance biological understanding

COMPSTAT David Edwards, Niels E. Raun, 2012-12-06 The papers assembled in this volume were presented at COMPSTAT 1988 the 8th biannual Symposium in Computational Statistics held under the auspices of the International Association for Statistical Computing The current impact of computers on the theory and practice of statistics can be traced at many levels on one level the ubiquitous personal

computer has made methods for explorative data analysis and display rarely even described in conventional statistics textbooks widely available At another level advances in computing power permit the development and application of statistical methods in ways that previously have been infeasible Some of these methods for example Bayesian methods are deeply rooted in the philosophical basis of statistics while others for example dynamic graphics present the classical statistical framework with quite novel perspectives The contents of this volume provide a cross section of current concerns and interests in computational statistics A dominating topic is the application of artificial intelligence to statistics and vice versa where systems deserving the label expert systems are just beginning to emerge from the haze of good intentions with which they hitherto have been clouded Other topics that are well represented include nonparametric estimation graphical techniques algorithmic developments in all areas projection pursuit and other computationally intensive methods COMPSTAT symposia have been held biannually since 1974 This tradition has made COMPSTAT a major forum for advances in computational statistics with contributions from many countries in the world Two new features have been introduced at COMPSTAT 88

The Epidemiology of Plant

Diseases D.G. Jones,2013-03-09 Most branches of science have what might be termed a core area which is both related to and helps to integrate peripheral topics to form the overall subject area Without this central link the subject is simply a collection of disparate albeit generally related topics What genetics is to plant breeding epidemiology is to the subject of plant pathology and no matter what individual topic is considered it is always possible to recognize the interaction with and relationship to epidemiological factors Broadly speaking until the 1950s plant pathology was considered as the applied side of mycology and indeed the British Society of Plant Pathology was spawned from its mentor the British Mycological Society with considerable help from The Association of Applied Biology However with the exploding world population and the growing demand for food plant pathologists became increasingly aware of the need for a more considered measured precise and even holistic approach to their subject and particularly to plant disease management Looking back over 40 years of teaching and research in plant pathology it was very clear that the core of the subject was epidemiology and that this new study was developing a very distinct identity which was rapidly being recognized in its own right The shotgun approach to plant disease control was quickly perceived to be too inexact and almost every aspect of the subject was being reviewed refined and advanced
