communications requires the command of many technical disciplines and the availability of up to date information on international recommendations system architectures and equipment standards. It is therefore necessary to involve many authors each possessing a good level of knowledge in a particular discipline. The problem of using a coherent and unambiguous set of definitions and basic terms has been solved by including in the book all the background information needed for understanding satellite communication systems without any major reference to other textbooks specializing in particular disciplines. The obvious consequence of this approach has been the large size of the book with the advantages however of practically complete independence from other books, more systematic discussion of the subject matter and better readability. After the required background information emphasis has been placed on the discussion of techniques and system design criteria rather than on specific equipment implementation or description of particular systems. The book may be divided in five parts as follows. The first five chapters provide most of the required background information. Chapter 6 is an introductory outline of satellite communication systems. Chapters 7 to 13 deal with the various aspects of technical system design. Chapter 14 discusses system economics. Chapter 15 provides a brief insight into some foreseeable future developments of satellite communications.

Satellite Communication Systems B.G. Evans, 1999. Updates from unremarked dates material used in the Institute's vacation schools at Surrey University which over the past 15 years have become the de facto industry standard in satellite communications. The approach concentrates on the design and planning of systems includes little theory and just quotes equations rather than deriving them. New material has been added on the history and background of the field, the business aspects of satellite communications and on new applications in mobile and personal communication systems, multimedia systems, military business and small satellites navigation and positioning. Graduate undergraduate and practicing engineers should benefit from the treatment. Annotation copyrighted by Book News Inc. Portland OR.

Digital Satellite Communications Systems and Technologies A. Nejat Ince, 2012-12-06. Among the space activities of the last three decades, satellite communications (SATCOM) has found the widest application in meeting both civil and military communications requirements. Several international, regional and national SATCOM systems of increasing capacity, capability and complexity have been and are being implemented over the years. The latest versions are utilizing such concepts as spot beams, processing transponders in SS/TDMA and operations in different frequency bands including the EHF band. On the military side, the United States of America, the United Kingdom, France and NATO, the North Atlantic Treaty Organisation have been the only owners and operators of military SATCOM systems in the West. The systems in being and under development use satellites and ground terminals with characteristics which differ from the civilian ones with respect to frequency bands utilised and survivability and interoperability. The SATCOM has given the military users the potential of having much needed mobility, flexibility and survivability in strategic and tactical communications for land, sea and air operations. It must however be said particularly for the military SATCOM systems that they have been evolved in big jumps.

both in time and capability each jump involving the deployment of two or three often specially designed large satellites large expenses and rather traumatic transition between jumps Despite these undesirable features these systems did not have the required degree of suevivability and flexibility
