## Investigating Surface Interactions

You saw that when the spring-launched cart was in contact with the box it pushed the box forward, when you removed a force from your hand that was keeping the spring temporarily deformed. Even though the cart was applying a force to the box when it was in contact with it, the box and cart always eventually came to a stop.

What are some everyday phenomena where objects seem to stop on their own after being put into motion?

If you drop something, even from the highest place in the world to the lowest place in the world, it will eventually come to a stop.

---

What causes all these moving objects to eventually come to a stop?

A surface or the ground stops them from going further down.

---

Different objects resting on different surfaces can be easier or harder to get to start moving. Let us think about what interactions are happening between the object and the surface it is resting on that can help explain why this is.

Use the materials your teacher sent home with you to carry out an investigation to figure out why some objects start and stop moving on some surfaces easier than others. You will use the rubber band to measure the amount of force it takes to pull a shoe across a surface. If the rubber band has to stretch more, then more force is being applied. If the rubber band stretches less, then less force is being

Volume 3. General and Applied Onomastics. Literary Onomastics. Chrematonomastics. Reports Urszula Bijak,Paweł Swoboda,Justyna B. Walkowiak,2023-12-08 Onomastics is an area of scholarly interest that has grown considerably in importance in recent years Consequently the 27th International Congress of Onomastic Sciences held in 2021 in Kraków Poland gathered scholars from all over the world active in all subfields of onomastic enquiry as well as those exploring the areas bordering on other disciplines of the humanities It thus became a venue for presenting state of the art research in the study of proper names proposing novel approaches and opening new vistas for future research The present work is the third of the three volumes of conference proceedings that are the fruit of the congress Being the most diverse thematically it contains contributions on the general and applied aspects of onomastics onymy in literature and other cultural texts and chrematonyms It ends with two reports The volume comprises 30 individual articles contributed by 35 scholars The first section devoted to general and applied onomastics features texts concerned with ever interesting questions relevant to all practitioners of the discipline the essence of properhood the meaning of proper names and onomastic terminology Scholars whose papers focused on applied onomastics were interested in problems occasioned by the translation of onyms by their pronunciation in cross cultural contact and by the use of exonyms drawing for exemplification on the Hungarian German and Czech language material

respectively Literary onomastics in its broad definition constitutes by far the largest part of the volume Contributors to this section represent diverse literatures including Scottish Russian Polish Czech and Nigerian The scope and internal subdivisions of literary onomastics are discussed and the activities of the Italian Society for Literary Onomastics are presented The name Dracula is analysed in depth and so is the Old Prussian onym Patollo Some researchers take a step into the wider realm of culture Their attention is attracted by the names of spirits in the beliefs adhered to in Southwest China by the proper names in a medieval Scottish document by the onyms that personify hunger in Italian wartime epistolography and by toponyms in video games The third section deals with chrematonyms as diverse as names of railway locomotives in Britain logonyms in Slovakia and perfume names in a Slovak online shop The naming patterns of Chinese restaurants in Czechia are studied too as well as the names of travel agencies in Germany Ukraine and Poland Finally the reader is presented with two reports One outlines new tendencies in Nordic socio onomastics while the other presents the new paradigm in the publication of Onoma the journal of the ICOS The book is a must not only for onomasticians but also for researchers in related disciplines ranging from history via human geography or philosophy of language to social studies However professionals active in naming will find it useful as well since it provides a much needed supranational perspective and enables cross cultural comparisons

**Assembly of the Photosystem II Membrane-Protein Complex of Oxygenic Photosynthesis** Julian J. Eaton-Rye, Roman Sobotka, 2017-08-08 Photosystem II is a 700 kDa membrane protein super complex responsible for the light driven splitting of water in oxygenic photosynthesis The photosystem is comprised of two 350 kDa complexes each made of 20 different polypeptides and over 80 co factors While there have been major advances in understanding the mature structure of this photosystem many key protein factors involved in the assembly of the complex do not appear in the holoenzyme The mechanism for assembling this super complex is a very active area of research with newly discovered assembly factors and subcomplexes requiring characterization Additionally the ability to split water is inseparable from light induced photodamage that arises from radicals and reactive O<sub>2</sub> species generated by Photosystem II chemistry Consequently to sustain water splitting a self repair cycle has evolved whereby damaged protein is removed and replaced so as to extend the working life of the complex Understanding how the biogenesis and repair processes are coordinated is among several important questions that remain to be answered Other questions include how and when are the inorganic cofactors inserted during the assembly and repair processes and how are the subcomplexes protected from photodamage during assembly Evidence has also been obtained for Photosystem II biogenesis centers in cyanobacteria but do these also exist in plants Do the molecular mechanisms associated with Photosystem II assembly shed fresh light on the assembly of other major energy transducing complexes such as Photosystem I or the cytochrome b<sub>6</sub> f complex or indeed other respiratory complexes The contributions to this Frontiers in Plant Science Research Topic are likely to reveal new details applicable to the assembly of a range of membrane protein complexes including aspects of self assembly and solar energy conversion that

may be applied to artificial photosynthetic systems In addition a deeper understanding of Photosystem II assembly particularly in response to changing environmental conditions will provide new knowledge underpinning photosynthetic yields which may contribute to improved food production and long term food security Hearings and Reports on Atomic Energy United States. Bohrsen ,Frank John Spera,2024-08-08 During transport a percolating melt or magma may contact rock or a magmatic mush resulting in inevitable interactions that may be described as magma melt rock or magma melt mush interactions Examples of these types of interactions include mantle metasomatism mineral melt reaction in the mantle mineral dissolution in magma crustal wallrock partial melting and thermal remobilization of preexisting mushy magma rejuvenation of mush by intruding high specific enthalpy magma This spectrum of processes plays a major role in the composition thickness and age of the mantle lithosphere and its associated crust These interactions also impact the asthenosphere because melts that form in the deepest parts of the mantle may ascend and interact with shallower mantle during transport **How Can Secretomics Help**

**Unravel the Secrets of Plant-Microbe Interactions?** Delphine Vincent,Kim Marilyn Plummer,Peter Solomon,Marc-Henri Lebrun,Dominique Job,Maryam Rafiqi,2017-01-27 Secretomics describes the global study of proteins that are secreted by a cell a tissue or an organism and has recently emerged as a field for which interest is rapidly growing The term secretome was first coined at the turn of the millennium and was defined to comprise not only the native secreted proteins released into the extracellular space but also the components of machineries for protein secretion Two secretory pathways have been described in fungi i the canonical pathway through which proteins bearing a N terminal peptide signal can traverse the endoplasmic reticulum and Golgi apparatus and ii the unconventional pathway for proteins lacking a peptide signal Protein secretion systems are more diverse in bacteria in which types I to VII pathways as well as Sec or two arginine Tat pathways have been described In oomycete species effectors are mostly small proteins containing an N terminal signal peptide for secretion and additional C terminal motifs such as RXLRs and CRNs for host targeting It has recently been shown that oomycetes exploit non conventional secretion mechanisms to transfer certain proteins to the extracellular environment Other non classical secretion systems involved in plant fungal interaction include extracellular vesicles EVs Figure 1 from Samuel et al 2016 Front Plant Sci 6 766 The versatility of oomycetes fungi and bacteria allows them to associate with plants in many ways depending on whether they are biotroph hemibiotroph necrotroph or saprotroph When interacting with a live organism a microbe will invade its plant host and manipulate its metabolisms either detrimentally if it is a pathogen or beneficially if it is a symbiote Deciphering secretomes became a crucial biological question when an increasing body of evidence indicated that secreted proteins were the main effectors initiating interactions whether of pathogenic or symbiotic nature between

microbes and their plant hosts Secretomics may help to contribute to the global food security and to the ecosystem sustainability by addressing issues in i plant biosecurity with the design of crops resistant to pathogens ii crop yield enhancement for example driven by arbuscular mycorrhizal fungi helping plant hosts utilise phosphate from the soil hence increase biomass and iii renewable energy through the identification of microbial enzymes able to augment the bio conversion of plant lignocellulosic materials for the production of second generation biofuels that do not compete with food production To this day more than a hundred secretomics studies have been published on all taxa and the number of publications is increasing steadily Secretory pathways have been described in various species of microbes and or their plant hosts yet the functions of proteins secreted outside the cell remain to be fully grasped This Research Topic aims at discussing how secretomics can assist the scientists in gaining knowledge about the mechanisms underpinning plant microbe interactions

**The Molecular Chaperones Interaction Networks in Protein Folding and Degradation** Walid A. Houry, 2014-09-01 Molecular chaperones are a fundamental group of proteins that have been identified only relatively recently They are key components of a protein quality machinery in the cell which insures that the folding process of any newly synthesized polypeptide chain results in the formation of a properly folded protein and that the folded protein is maintained in an active conformation throughout its functional lifetime Molecular chaperones have been shown to play essential roles in cell viability under both normal and stress conditions Chaperones can also assist in the unfolding and degradation of misfolded proteins and in disaggregating preformed protein aggregates Chaperones are also involved in other cellular functions including protein translocation across membranes vesicle fusion events and protein secretion In recent years tremendous advances have been made in our understanding of the biology biochemistry and biophysics of function of molecular chaperones In addition recent technical developments in the fields of proteomics and genomics allowed us to obtain a global view of chaperone interaction networks Finally there is now a growing interest in the role of molecular chaperones in diseases This book will provide a comprehensive analysis of the structure and function of the diverse systems of molecular chaperones and their role in cell stress responses and in diseases from a global network perspective
