Rapid Prototyping Laserbased And Other Technologies:

Rapid Prototyping Patri K. Venuvinod, Weiyin Ma, 2013-04-17 Since the dawn of civilization mankind has been engaged in the conception and manufacture of discrete products to serve the functional needs of local customers and the tools technology needed by other craftsmen In fact much of the progress in civilization can be attributed to progress in discrete product manufacture The functionality of a discrete object depends on two entities form and material composition For instance the aesthetic appearance of a sculpture depends upon its form whereas its durability depends upon the material composition An ideal manufacturing process is one that is able to automatically generate any form freeform in any material However unfortunately most traditional manufacturing processes are severely constrained on all these counts There are three basic ways of creating form conservative subtractive and additive In the first approach we take a material and apply the needed forces to deform it to the required shape without either adding or removing material i e we conserve material Many industrial processes such as forging casting sheet metal forming and extrusion emulate this approach A problem with many of these approaches is that they focus on form generation without explicitly providing any means for controlling material composition In fact even form is not created directly They merely duplicate the external form embedded in external tooling such as dies and molds and the internal form embedded in cores etc Till recently we have had to resort to the subtractive approach to create the form of the tooling

Materials Processing Lorraine F. Francis, 2024-04-25 Materials Processing A Unified Approach to Processing of Metals Ceramics and Polymers Second Edition is the first textbook to bring the fundamental concepts of materials processing together in a unified approach that highlights the overlap in scientific and engineering principles It teaches students the key principles involved in the processing of engineering materials specifically metals ceramics and polymers from starting or raw materials through to the final functional forms Its self contained approach is based on the state of matter most central to the shaping of the material melt solid powder dispersion and solution and vapor With this approach students learn processing fundamentals and appreciate the similarities and differences between the materials classes This fully updated edition includes expanded coverage on additive manufacturing as well as adding a new section on machining The organization has been modified and a greater emphasis has been placed on the fundamentals of processing and manufacturing methods This book can be utilized by upper level undergraduates and beginning graduate students in Materials Science and Engineering who are already schooled in the structure and properties of metals ceramics and polymers and are ready to apply their knowledge to materials processing It will also appeal to students from other engineering disciplines who have completed an introductory materials science and engineering course Includes comprehensive coverage on the fundamental concepts of materials processing Provides coverage of metals ceramics and polymers in one text Presents examples of both standard and newer additive manufacturing methods throughout Gives students an overview on the methods that they will likely encounter in their careers

Interdisciplinary Process Innovations explores a new philosophy of engineering. An in depth introduction to Intelligent Energy Field Manufacturing EFM this book explores a fresh engineering methodology that not only integrates but goes beyond methodologies such as Design for Six Sigma Lean Manufacturing Concurrent Engineering TRIZ green and sustainable manufacturing and more. This book gives a systematic introduction to classic non mechanical manufacturing processes as well as offering big pictures of some technical frontiers in modern engineering. The book suggests that any manufacturing process is actually a process of injecting human intelligence into the interaction between material and the various energy fields in order to transfer the material into desired configurations. It discusses technological innovation dynamic M PIE flows the generalities of energy fields logic functional materials and intelligence the open scheme of intelligent EFM implementation and the principles of intelligent EFM. The book takes a highly interdisciplinary approach that includes research frontiers such as micro nano fabrication high strain rate processes laser shock forming materials science and engineering bioengineering etc in addition to a detailed treatment of the so called non traditional manufacturing processes which covers waterjet machining laser material processing ultrasonic material processing EDM ECM etc. Filled with illustrative pictures figures and tables that make technical materials more absorbable the book cuts across multiple engineering disciplines. The majority of books in this area report the facts of proven knowledge while the behind the scenes thinking is usually neglected. This book examines the big picture of manufacturing in depth before diving into the deta
