Simultaneity and Delay Jay Lampert, 2012-02-09 Through original speculations on the surprisingly complementary concepts of simultaneity and delay and new interpretations of the great philosophers of time this book proposes an innovative theory of staggered time In the early 20th Century Bergson and Husserl following Einstein made Simultaneity what it means for events to occur at the same time a central motif in philosophy In the late 20th Century Derrida and Deleuze instead emphasized Delay events staggered over distant times This struggle between convergent and staggered time also plays out in 20th Century aesthetics especially music politics and the sciences Despite their importance in the history of philosophy this is the first book to comprehensively examine the concepts of simultaneity and delay By putting simultaneity and delay into a dialectical relation this book argues that time in general is organized by elastic rhythms Lampert's concepts describe the

Playwright, Space and Place in Early Modern Performance Tim Fitzpatrick, 2016-04-22 Analyzing Elizabethan and Jacobean playtexts for their spatial implications this innovative study discloses the extent to which the resources and constraints of public playhouse buildings affected the construction of the fictional worlds of early modern plays The study argues that playwrights were writing with foresight inscribing the constraints and resources of the stages into their texts It goes further to posit that Shakespeare and his playwright contemporaries adhered to a set of generic conventions rather than specific local company practices about how space and place were to be related in performance the playwrights constituted thus an overarching virtual company producing playtexts that shared features across the acting companies and playhouses By clarifying a sixteenth to seventeenth century conception of theatrical place Tim Fitzpatrick adds a new layer of meaning to our understanding of the plays His approach adds a new dimension to these particular documents which though many of them are considered of great literary worth were not originally generated for any other reason than to be performed within a specific performance context The fact that the playwrights were aware of the features of this performance tradition makes their texts a potential mine of performance information and casts light back on the texts themselves if some of their meanings are spatial these will have been missed by purely literary tools of analysis

Video Mining Azriel Rosenfeld, David Doermann, Daniel DeMenthon, 2013-03-09 Traditionally scientific fields have defined boundaries and scientists work on research problems within those boundaries However from time to time those boundaries get shifted or blurred to evolve new fields For instance the original goal of computer vision was to understand a

single image of a scene by identifying objects their structure and spatial arrangements This has been referred to as image understanding Recently computer vision has gradually been making the transition away from understanding single images to analyzing image sequences or video Video understanding deals with understanding of video understanding sequences e g recognition of gestures activities facial expressions etc The main shift in the classic paradigm has been from the recognition of static objects in the scene to motion based recognition of actions and events Video understanding has overlapping research problems with other fields therefore blurring the fixed boundaries Computer graphics image processing and video databases have obvious overlap with computer vision The main goal of computer graphics is to generate and animate realistic looking images and videos Researchers in computer graphics are increasingly employing techniques from computer vision to generate the synthetic imagery A good example of this is image based rendering and modeling techniques in which geometry appearance and lighting is derived from real images using computer vision techniques Here the shift is from synthesis to analysis followed by synthesis Image processing has always overlapped with computer vision because they both inherently work directly with images

Indoor Scene Recognition by 3-D Object Search Pascal Meißner,2019-10-11 This book focuses on enabling mobile robots to recognize scenes in indoor environments in order to allow them to determine which actions are appropriate at which points in time In concrete terms future robots will have to solve the classification problem represented by scene recognition sufficiently well for them to act independently in human centered environments To achieve accurate yet versatile indoor scene recognition the book presents a hierarchical data structure for scenes the Implicit Shape Model trees Further it also provides training and recognition algorithms for these trees In general entire indoor scenes cannot be perceived from a single point of view To address this problem the authors introduce Active Scene Recognition ASR a concept that embeds canonical scene recognition in a decision making system that selects camera views for a mobile robot to drive to so that it can find objects not yet localized The authors formalize the automatic selection of camera views as a Next Best View NBV problem to which they contribute an algorithmic solution which focuses on realistic problem modeling while maintaining its computational efficiency Lastly the book introduces a method for predicting the poses of objects to be searched establishing the otherwise missing link between scene recognition and NBV estimation

Digital Image Analysis Walter Kropatsch,Horst Bischof,2006-05-10 The human visual system as a

functional unit including the eyes the nervous system and the corresponding parts of the brain certainly ranks among the most important means of human information processing The efficiency of the biological systems is beyond the capabilities of today's technical systems even with the fastest available computer systems However there are areas of application where digital image analysis systems produce acceptable results Systems in these areas solve very specialized tasks they operate in a limited environment and high speed is often not necessary Several factors determine the economical application of technical vision systems cost speed reliability robustness functionality and integration with other system components Many of the recent developments in digital image processing and pattern recognition show some of the required achievements Computer vision enhances the capabilities of computer systems in autonomously collecting large amounts of data in extracting relevant information in perceiving its environment and in automatic or semiautomatic operation in this environment The development of computer systems in general shows a steadily increasing need in computational power which comes with decreasing hardware costs
