Regularization of Inverse Problems Heinz Werner Engl, Martin Hanke, A. Neubauer, 1996-07-31 This book is devoted to the mathematical theory of regularization methods and gives an account of the currently available results about regularization methods for linear and nonlinear ill posed problems Both continuous and iterative regularization methods are considered in detail with special emphasis on the development of parameter choice and stopping rules which lead to optimal convergence rates

Numerical Regularization for Atmospheric Inverse Problems Adrian Doicu, Thomas Trautmann, Franz Schreier, 2010-07-16 The retrieval problems arising in atmospheric remote sensing belong to the class of the called discrete ill posed problems These problems are unstable under data perturbations and can be solved by numerical regularization methods in which the solution is stabilized by taking additional information into account The goal of this research monograph is to present and analyze numerical algorithms for atmospheric retrieval The book is aimed at physicists and engineers with some background in numerical linear algebra and matrix computations Although there are many practical details in this book for a robust and efficient implementation of all numerical algorithms the reader should consult the literature cited The data

model adopted in our analysis is semi stochastic From a practical point of view there are no significant differences between a semi stochastic and a deterministic framework the differences are relevant from a theoretical point of view e.g. in the convergence and convergence rates analysis After an introductory chapter providing the state of the art in passive atmospheric remote sensing Chapter 2 introduces the concept of ill posedness for linear discrete equations To illustrate the difficulties associated with the solution of discrete ill posed problems we consider the temperature retrieval by nadir sounding and analyze the solvability of the discrete equation by using the singular value decomposition of the forward model matrix

Regularization for Applied Inverse and Ill-Posed Problems, 2013-11-22 Linear Inverse Problems and Tikhonov Regularization Mark S. Gockenbach, 2016 *Variational Source Conditions, Quadratic Inverse Problems, Sparsity Promoting Regularization* Jens Flemming, 2018-09-08 The book collects and contributes new results on the theory and practice of ill posed inverse problems Different notions of ill posedness in Banach spaces for linear and nonlinear inverse problems are discussed not only in standard settings but also in situations up to now not covered by the literature Especially ill posedness of linear operators with uncomplemented null spaces is examined Tools for convergence rate analysis of regularization methods are extended to a wider field of applicability It is shown that the tool known as variational source condition always yields convergence rate results A theory for nonlinear inverse problems with quadratic structure is developed as well as corresponding regularization methods The new methods are applied to a difficult inverse problem from laser optics Sparsity promoting regularization is examined in detail from a Banach space point of view Extensive convergence analysis reveals new insights into the behavior of Tikhonov type regularization with sparsity enforcing penalty Regularization of Inverse Problems for Turning Processes Anna Christina Brandt, 2013-01-24 In this thesis we will focus on inverse problems appearing in ultra precise turning processes Ultra precision turning is widely used to manufacture metallic surfaces with high surface quality One crucial influencing factor of the surface quality is unbalances leading to vibrations of the machine structure and interaction with the cutting process This interaction is the so called process machine interaction Therefore a model is built which simulates the influence of unbalances of the machine structure and process parameters on the resulting surface of the workpiece In order to include the process machine interaction into the model a new force model for ultra precision turning is developed The resulting interaction model is based on a nonlinear parameter dependent system of ordinary differential equations The corresponding forward model is thus described by the map connecting the input parameters to the solution of this equation system The main part of the thesis is the inversion of the forward operator i.e. for a given tool path on the workpiece the necessary input parameters are computed such that solving the forward model with this new input parameters results in the desired tool path Since the forward problem is ill posed regularization methods with sparsity constraints are applied which promote sparse solutions The advantage of such sparse solutions is that they limit the points of machine changes in the machine control Two different applications are treated in detail and illustrated with various numerical
