Regularity Theory For Quasilinear Elliptic Systems And Monge Ampere Equations In Two Dimensions:

Regularity Theory for Quasilinear Elliptic Systems and Monge - Ampere Equations in Two Dimensions

Friedmar Schulz, 2006-12-08 These lecture notes have been written as an introduction to the characteristic theory for two dimensional Monge Ampere equations a theory largely developed by H Lewy and E Heinz which has never been presented in book form An exposition of the Heinz Lewy theory requires auxiliary material which can be found in various monographs but which is presented here in part because the focus is different and also because these notes have an introductory character Self contained introductions to the regularity theory of elliptic systems the theory of pseudoanalytic functions and the theory of conformal mappings are included These notes grew out of a seminar given at the University of Kentucky in the fall of 1988 and are intended for graduate students and researchers interested in this area

Regularity Theory for Quasilinear Elliptic Systems and Monge-Ampere Equations in Two Dimensions Friedmar Schults, 1900 Analysis of

Monge-Ampère Equations Nam Q. Le, 2024-03-07 This book presents a systematic analysis of the Monge Ampere equation the linearized Monge Ampere equation and their applications with emphasis on both interior and boundary theories Starting from scratch it gives an extensive survey of fundamental results essential techniques and intriguing phenomena in the solvability geometry and regularity of Monge Ampere equations It describes in depth diverse applications arising in geometry fluid mechanics meteorology economics and the calculus of variations The modern treatment of boundary behaviors of solutions to Monge Ampere equations a very important topic of the theory is thoroughly discussed The book synthesizes many important recent advances including Savin's boundary localization theorem spectral theory and interior and boundary regularity in Sobolev and Hlder spaces with optimal assumptions It highlights geometric aspects of the theory and connections with adjacent research areas This self contained book provides the necessary background and techniques in convex geometry real analysis and partial differential equations presents detailed proofs of all theorems explains subtle constructions and includes well over a hundred exercises It can serve as an accessible text for graduate students as well as researchers interested in this subject

Convex Analysis and Nonlinear Geometric Elliptic Equations Ilya J. Bakelman, 2012-12-06 Investigations in modern nonlinear analysis rely on ideas methods and problems from various fields of mathematics mechanics physics and other applied sciences In the second half of the twentieth century many prominent exemplary problems in nonlinear analysis were subject to intensive study and examination The united ideas and methods of differential geometry topology differential equations and functional analysis as well as other areas of research in mathematics were successfully applied towards the complete solution of complex problems in nonlinear analysis It is not possible to encompass in the scope of one book all concepts ideas methods and results related to nonlinear analysis Therefore we shall restrict ourselves in this monograph to nonlinear elliptic boundary value problems as well as global geometric problems In order that we may examine these problems we are provided with a fundamental vehicle The theory of convex bodies and hypersurfaces In this book we

systematically present a series of centrally significant results obtained in the second half of the twentieth century up to the present time Particular attention is given to profound interconnections between various divisions in nonlinear analysis The theory of convex functions and bodies plays a crucial role because the ellipticity of differential equations is closely connected with the local and global convexity properties of their solutions Therefore it is necessary to have a sufficiently large amount of material devoted to the theory of convex bodies and functions and their connections with partial differential equations

Hans Lewy Selecta Hans Lewy, 2002 The work of Hans Lewy 1904 1988 has had a profound influence in the direction of applied mathematics and partial differential equations in particular from the late 1920s Two of the particulars are well known The Courant Friedrichs Lewy condition 1928 or CFL condition was devised to obtain existence and approximation results This condition relating the time and spatial discretizations for finite difference schemes is now universally employed in the simulation of solutions of equations describing propagation phenomena Lewy's example of a linear equation with no solution 1957 with its attendant consequence that most equations have no solution was not merely an unexpected fact but changed the viewpoint of the entire field Lewy made pivotal contributions in many other areas for example the regularity theory of elliptic equations and systems the Monge Ampère Equation the Minkowski Problem the asymptotic analysis of boundary value problems and several complex variables He was among the first to study variational inequalities In much of his work his underlying philosophy was that simple tools of function theory could help one understand the essential concepts embedded in an issue although at a cost in generality This approach was extremely successful In this two volume work most all of Lewy's papers are presented in chronological order They are preceded by several short essays about Lewy himself prepared by Helen Lewy Constance Reid and David Kinderlehrer and commentaries on his work by Erhard Heinz Peter Lax Jean Leray Richard MacCamy François Trèves and Louis Nirenberg Additionally there are Lewy's own remarks on the occasion of his honorary degree from the University of Bonn

Nonlinear Problems in Mathematical Physics and Related Topics I Michael Sh. Birman, Stefan Hildebrandt, Vsevolod A. Solonnikov, Nina N. Uraltseva, 2012-12-06 The new series International Mathematical Series founded by Kluwer Plenum Publishers and the Russian publisher Tamara Rozhkovskaya is published simultaneously in English and in Russian and starts with two volumes dedicated to the famous Russian mathematician Professor Olga Aleksandrovna Ladyzhenskaya on the occasion of her 80th birthday O A Ladyzhenskaya graduated from the Moscow State University But throughout her career she has been closely connected with St Petersburg where she works at the V A Steklov Mathematical Institute of the Russian Academy of Sciences Many generations of mathematicians have become familiar with the nonlinear theory of partial differential equations reading the books on quasilinear elliptic and parabolic equations written by O A Ladyzhenskaya with V A Solonnikov and N N Uraltseva Her results and methods on the Navier Stokes equations and other mathematical problems in the theory of viscous fluids nonlinear partial differential equations and systems the regularity theory some directions of computational analysis are well

known So it is no surprise that these two volumes attracted leading specialists in partial differential equations and mathematical physics from more than 15 countries who present their new results in the various fields of mathematics in which the results methods and ideas of O A Ladyzhenskaya played a fundamental role Nonlinear Problems in Mathematical Physics and Related Topics I presents new results from distinguished specialists in the theory of partial differential equations and analysis A large part of the material is devoted to the Navier Stokes equations which play an important role in the theory of viscous fluids In particular the existence of a local strong solution in the sense of Ladyzhenskaya to the problem describing some special motion in a Navier Stokes fluid is established Ladyzhenskaya s results on axially symmetric solutions to the Navier Stokes fluid are generalized and solutions with fast decay of nonstationary Navier Stokes equations in the half space are stated Application of the Fourier analysis to the study of the Stokes wave problem and some interesting properties of the Stokes problem are presented The nonstationary Stokes problem is also investigated in nonconvex domains and some L_p estimates for the first order derivatives of solutions are obtained New results in the theory of fully nonlinear equations are presented Some asymptotics are derived for elliptic operators with strongly degenerated symbols New results are also presented for variational problems connected with phase transitions of means in controllable dynamical systems nonlocal problems for quasilinear parabolic equations elliptic variational problems with nonstandard growth and some sufficient conditions for the regularity of lateral boundary Additionally new results are presented on area formulas estimates for eigenvalues in the case of the weighted Laplacian on Metric graph application of the direct Lyapunov method in continuum mechanics singular perturbation property of capillary surfaces partially free boundary problem for parametric double integrals

Calculus of Variations, Applications and Computations C Bandle, Michel Chipot, J Saint Jean Paulin, Josef Bemelmans, I Shafrir, 1995-04-26 This research presents some important domains of partial differential equations and applied mathematics including calculus of variations control theory modelling numerical analysis and various applications in physics mechanics and engineering These topics are now part of many areas of science and have experienced tremendous development during the last decades

Minimal Surfaces Ulrich Dierkes, Stefan Hildebrandt, Friedrich Sauvigny, 2010-08-16 Minimal Surfaces is the first volume of a three volume treatise on minimal surfaces Grundlehren Nr 339 341 Each volume can be read and studied independently of the others The central theme is boundary value problems for minimal surfaces The treatise is a substantially revised and extended version of the monograph Minimal Surfaces I II Grundlehren Nr 295 this is done in the context of stable H surfaces i e of stable surfaces of prescribed mean curvature H especially of cmc surfaces $H = \text{const}$ and leads to curvature estimates for stable immersed cmc surfaces and to Nitsche s uniqueness theorem and Tomi s finiteness result In addition a theory of unstable solutions of Plateau s problems is developed which is based on Courant s mountain pass lemma Furthermore Dirichlet s problem for nonparametric H surfaces is solved using the solution of Plateau s problem for H surfaces and the pertinent estimates

Lectures on Probability Theory

Dominique Bakry, Richard D. Gill, Stanislav A. Molchanov, 2006-11-15 This book contains work outs of the notes of three 15 hour courses of lectures which constitute surveys on the concerned topics given at the St Flour Probability Summer School in July 1992 The first course by D Bakry is concerned with hypercontractivity properties and their use in semi group theory namely Sobolev and Log Sobolev inequalities with estimations on the density of the semi groups The second one by R D Gill is about statistics on survival analysis it includes product integral theory Kaplan Meier estimators and a look at cryptography and generation of randomness The third one by S A Molchanov covers three aspects of random media homogenization theory localization properties and intermittency Each of these chapters provides an introduction to and survey of its subject

Geometric Theory of Singular Phenomena in Partial Differential Equations Jean Pierre Bourguignon, Paolo de Bartolomeis, Mariano Giaquinta, 1998-05-28 Featuring contributions from a group of outstanding mathematicians this book covers the most recent advances in the geometric theory of singular phenomena of partial differential equations occurring in real and complex differential geometry Gathering together papers from a workshop held in Cortona Italy this volume will be of great interest to all those whose research interests lie in real and complex differential geometry partial differential equations and gauge theory
