phase transitions and macromolecular crowding      Leaf Defence Edward E. Farmer, 2014-05-01 Leaves are among the most abundant organs on earth and are a defining feature of most terrestrial ecosystems However a leaf is also a potential meal for a hungry animal and the question therefore arises why does so much foliage survive in nature What mechanisms protect leaves so that on a global scale only a relatively small proportion of living leaf material is consumed Leaf survival is in large part due to two processes firstly leaf eating organisms fall prey to predators top down pressure on the herbivore secondly leaves defend themselves bottom up pressure on the herbivore Remarkably these two types of event are often linked they are controlled and coordinated by plants and the molecular mechanisms that underlie this are now beginning to emerge This novel text focuses exclusively on the leaf on the herbivorous organisms that attack leaves and the mechanisms that plants use to defend these vital organs It begins with an assessment of the scale of herbivory before examining direct physical and chemical defences on leaf surfaces and within the leaf itself Although some leaf defences are easily seen most operate at the molecular level and are therefore invisible to the naked eye Many of these recently elucidated mechanisms are described Throughout the book perspectives from both the laboratory and the field are combined A central feature of the work is its emphasis on the coevolution of leaf defences and the digestive tracts of animals including humans making the book of relevance in understanding the role of leaf defences in agriculture Leaf Defence is suitable for senior undergraduate and graduate students taking courses in plant science as well as a broader audience of biologists and biochemists seeking a comprehensive and authoritative overview of this exciting and emerging topic      Encyclopedia of Fish Physiology, 2011-06-01 Fish form an extremely diverse group of vertebrates At a conservative estimate at least 40% of the world's vertebrates are fish On the one hand they are united by their adaptations to an aquatic environment and on the other they show a variety of adaptations to differing environmental conditions often to extremes of temperature salinity oxygen level and water chemistry They exhibit an array of behavioural and reproductive systems Interesting in their own right this suite of adaptive physiologies provides many model systems for both comparative vertebrate and human physiologists This four volume encyclopedia covers the diversity of fish physiology in over 300 articles and provides entry level information for students and summary overviews for researchers alike Broadly organised into four themes articles cover Functional Thematic and Phylogenetic Physiology and Fish Genomics Functional articles address the traditional aspects of fish physiology that are common to all areas of vertebrate physiology including Reproduction Respiration Neural Sensory Central Effector Endocrinology Renal Cardiovascular Acid base Balance Osmoregulation Ionoregulation Digestion Metabolism Locomotion and so on Thematic Physiology articles are carefully selected and fewer in number They provide a level of integration that goes beyond the coverage in the Functional Physiology topics and include discussions of Toxicology Air breathing Migrations Temperature Endothermy etc Phylogenetic Physiology articles bring together information that bridges the physiology of certain groupings of fishes where the knowledge base has a sufficient depth and breadth and include articles on Ancient

Fishes Tunas Sharks etc Genomics articles describe the underlying genetic component of fish physiology and high light their suitability and use as model organisms for the study of disease stress and physiological adaptations and reactions to external conditions Winner of a 2011 PROSE Award Honorable Mention for Multivolume Science Reference from the Association of American Publishers The definitive encyclopedia for the field of fish physiology Three volumes which comprehensively cover the entire field in over 300 entries written by experts Detailed coverage of basic functional physiology of fishes physiological themes in fish biology and comparative physiology amongst taxonomic Groups Describes the genomic bases of fish physiology and biology and the use of fish as model organisms in human physiological research Includes a glossary of terms

Anemia Donald Silverberg, 2012-02-29 This book provides an up to date summary of many advances in our understanding of anemia including its causes and pathogenesis methods of diagnosis and the morbidity and mortality associated with it Special attention is paid to the anemia of chronic disease Nutritional causes of anemia especially in developing countries are discussed Also presented are anemias related to pregnancy the fetus and the newborn infant Two common infections that cause anemia in developing countries malaria and trypanosomiasis are discussed The genetic diseases sickle cell disease and thalassemia are reviewed as are Paroxysmal Nocturnal Hemoglobinuria Fanconi anemia and some anemias caused by toxins Thus this book provides a wide coverage of anemia which should be useful to those involved in many fields of anemia from basic researchers to epidemiologists to clinical practitioners Systems Modeling: Approaches and Applications - Volume II
