Lathrop, 2011-12-12 Think of the Highlands as the backyard and backstop of the Philadelphia New York Hartford metroplex A backyard that spans over three million acres across Pennsylvania New York and Connecticut the

Highlands serves as recreational open space for the metroplex's burgeoning human population. As backstop, Highlands watersheds provide a ready source of high quality drinking water for over fifteen million people. The Highlands is the first book to examine the natural and cultural landscape of this four state region showing how it's distinctive and why its conservation is vital. Each chapter is written by a different leading researcher and specialist in that field and introduces readers to another aspect of the Highlands: its geological foundations, its aquifers and watersheds, its forest ecology, its past iron industry. In the 1800s the Highlands were mined, cutover and then largely abandoned. Given time the forests regenerated, the land healed and the waters cleared. Increasingly, however, the Highlands are under assault again: polluted runoff contaminating lakes and streams, invasive species choking out the local flora and fauna, exurban sprawl blighting the rural landscape and climate change threatening the integrity of its ecosystems. The Highlands makes a compelling case for land use planning and resource management strategies that could help ensure a sustainable future for the region, strategies that could in turn be applied to other landscapes threatened by urbanization across the country. The Highlands are a valuable resource. And now so is The Highlands.

Cumberland Head Connector Road, Town of Plattsburgh, Clinton County, 2004. **Air Pollutant Deposition and Its Effects on Natural Resources in New York State** Timothy J.

Sullivan, 2015-10-05. Ecosystem effects from air pollution in the Adirondacks, Catskills and elsewhere in New York have been substantial. Efforts to characterize and quantify these impacts and to examine more recent recovery have focused largely on surface waters, soils and forests. Lakes, streams and soils have acidified. Estuaries have become more eutrophic. Nutrient cycles have been disrupted. Mercury has bioaccumulated to toxic levels. Plant species composition has changed. Some surface waters show signs of partial chemical recovery in response to emissions control programs, but available data suggest that soil chemistry may continue to deteriorate under expected future emissions and deposition. Resource managers, policymakers and scientists now need to know the extent to which current and projected future emissions reductions will lead to ecosystem recovery. In this book, Timothy J. Sullivan provides a comprehensive synthesis of past, current and potential future conditions regarding atmospheric sulfur, nitrogen oxides, ammonium and mercury deposition, surface water chemistry, soil chemistry, forests and aquatic biota in New York, providing much needed information to help set emissions reduction goals, evaluate incremental improvements, conduct cost-benefit analyses and prioritize research needs. He draws upon a wealth of research conducted over the past thirty years that has categorized, quantified and advanced understanding of ecosystem processes related to atmospheric deposition of strong acids, nutrients and mercury and associated ecosystem effects. An important component of this volume is the new interest in the management and mitigation of ecosystem damage from air pollution stress, which builds on the critical loads approach pioneered in Europe and now gaining interest in the United States. This book will inform scientists, resource managers and policy analysts regarding the state of scientific knowledge on these complex topics and their policy relevance and will help to guide public policy assessment work in New York, the Northeast.
