Abstract

Abstract To determine what can be learned from the literature on the effectiveness of training for a particular population of workers, a review of the literature on training effectiveness was conducted. The review was limited to studies that had been published in the last 10 years and that had been conducted in the United States. The review found that the most common method of training was classroom instruction, and that the most common method of evaluation was self-report. The review also found that the most common outcome measure was knowledge, and that the most common method of data collection was a survey. The review found that the most common method of data analysis was a t-test, and that the most common method of data presentation was a bar chart. The review found that the most common method of data interpretation was a comparison to a control group, and that the most common method of data conclusion was a statement of the effectiveness of the training.
