Random Processes Measurement Analysis And Simulation:

Random Processes: Measurement, Analysis and Simulation J. Cacko, M. Bily, J. Bukoveczky, 2012-12-02 This book covers the basic topics associated with the measurement analysis and simulation of random environmental processes which are encountered in practice when dealing with the dynamics fatigue and reliability of structures in real environmental conditions The treatment is self contained and the authors have brought together and integrated the most important information relevant to this topic in order that the newcomer can see and study it as a whole This approach should also be of interest to experienced engineers from fatigue laboratories who want to learn more about the possible methods of simulation especially for use in real time on electrohydraulic computer controlled loading machines Problems of constructing a measuring system are dealt with in the first chapter Here the authors discuss the choice of measuring conditions and locations as well as the organization of a chain of devices for measuring and recording random environmental processes Some experience gained from practical measurements is also presented The recorded processes are further analysed by various methods The choice is governed by the aims of the measurements and applications of the results Chapter 2 is thus devoted to methods of random process evaluations for digital computers both from the fatigue and dynamic point of view The most important chapter is Chapter 3 as this presents a review of up to date methods of random process simulation with given statistical characteristics These methods naturally follow those of random process analysis and their results form initial data for the corresponding simulations algorithms including occurrences of characteristic parameters of counting methods reproduction of correlation theory characteristics and of autoregressive models The simulation of non stationary processes is treated in depth taking into account their importance for practical applications and also the lack of information of this subject The book is intended to help resolve many practical problems concerning the methods and quality of environmental process evaluation and simulation which can arise when up to date loading systems with computer control are being used in material component and structural fatigue and dynamic research *Random Processes* Jozef Čačko, Matěj Bílý, Juraj

Bukoveczky, 1988 This book covers the basic topics associated with the measurement analysis and simulation of random environmental processes which are encountered in practice when dealing with the dynamics fatigue and reliability of structures in real environmental conditions **Information-Measuring Systems** Vitalii Babak, Serhii Babak, Volodymyr

Eremenko, Yurii Kuts, Artur Zaporozhets, 2025-05-31 This book concentrates on virtual IMS with the use of modern information and measurement modeling technologies Modern IMS can be implemented as real hardware and software measuring tools virtual IMS with the use of modern information and measurement modeling technologies including simulation mathematical physical with extensive use of computer equipment for conducting a simulation measurement experiment Compared to real ones virtual IMS has a number of advantages and their implementation requires less time production and financial costs However in a number of cases due to the information uncertainty of the object of measurement

such IMS cannot provide objective and reliable results and therefore it is necessary to conduct a full scale measurement experiment using real systems The potential capabilities of modern systems at the stage of information development of society have increased significantly which contributes both to the expansion of the subject areas of their application and their use to increase the efficiency of known and solve new scientific and applied measurement tasks The authors are in solidarity with other colleagues specialists in measurements in the forecasts of the development of IMS No improvements in measurement information technologies including computer and intellectual ones have not led are not leading and obviously cannot lead in future to the expansion of the nomenclature of measurements of quantities while there are no corresponding sensors that form primary information during their direct interaction with the research object Further development of IMS and their use in various fields of science and technology including quantum metrology and nanotechnology will largely be determined by the development of new principles of operation and the creation of new types of sensors based on them
