Model Reduction Methods for Vector Autoregressive Processes Ralf Brüggemann, 2004-01-14 Vector Autoregressive VAR models have become one of the dominant tools for the empirical analysis of macroeconomic time series Sometimes the flexibility of VAR models leads to overparameterized models making accurate estimates of impulse responses and forecasts difficult This book introduces a variety of data based model reduction methods and provides a detailed investigation of different reduction strategies in the context of popular VAR modelling classes including stationary cointegrated and structural VAR models VAR practitioners benefit from guidelines being developed for using model reduction in applied work The use of different reduction techniques is illustrated by means of empirical models for US monetary policy shocks and a structural vector error correction model of the German labor market

Approximate Commutative Algebra Lorenzo Robbiano, John Abbott, 2009-09-18 Approximate Commutative Algebra is an emerging field of research which endeavours to bridge the gap between traditional exact Computational Commutative Algebra and approximate numerical computation The last 50 years have seen enormous progress in the realm of exact Computational Commutative Algebra and given the importance of polynomials in scientific modelling it is very natural to want to extend these ideas to handle approximate empirical data deriving from physical measurements of phenomena in the real world In this volume nine contributions from established researchers describe various approaches to tackling a variety of problems arising in Approximate Commutative Algebra

Geometric Algorithms and Combinatorial Optimization Martin Grötschel, Laszlo Lovasz, Alexander Schrijver, 2012-12-06 Historically there is a close connection between geometry and optImization This is illustrated by methods like the gradient method and the simplex method which are associated with clear geometric pictures In combinatorial optimization however many of the strongest and most frequently used algorithms are based on the discrete structure of the problems the greedy algorithm shortest path and alternating path methods branch and bound etc In the last several years geometric methods in particular polyhedral combinatorics have played a more and more profound role in combinatorial optimization as well Our

book discusses two recent geometric algorithms that have turned out to have particularly interesting consequences in combinatorial optimization at least from a theoretical point of view These algorithms are able to utilize the rich body of results in polyhedral combinatorics The first of these algorithms is the ellipsoid method developed for nonlinear programming by N Z Shor D B Yudin and A S Nemirovskii It was a great surprise when L G Khachiyan showed that this method can be adapted to solve linear programs in polynomial time thus solving an important open theoretical problem While the ellipsoid method has not proved to be competitive with the simplex method in practice it does have some features which make it particularly suited for the purposes of combinatorial optimization The second algorithm we discuss finds its roots in the classical geometry of numbers developed by Minkowski This method has had traditionally deep applications in number theory in particular in diophantine approximation

Shock capturing and high-order methods for hyperbolic conservation laws Jan Glaubitz , 2020-03-20 This thesis is concerned with the numerical treatment of hyperbolic conservation laws These play an important role in describing many natural phenomena Challenges in their theoretical as well as numerical study stem from the fact that spontaneous shock discontinuities can arise in their solutions even in finite time and smooth initial states Moreover the numerical treatment of hyperbolic conservation laws involves many different fields from mathematics physics and computer science As a consequence this thesis also provides contributions to several different fields of research which are still connected by numerical conservation laws however These contributions include but are not limited to the construction of stable high order quadrature rules for experimental data the development of new stable numerical methods for conservation laws and the investigation and design of shock capturing procedures as a means to stabilize high order numerical methods in the presence of shock discontinuities Jan Glaubitz was born in Braunschweig Germany in 1990 and completed his mathematical studies B Sc 2014 M Sc 2016 Dr rer nat 2019 at TU Braunschweig In 2016 he received awards from the German Mathematical Society DMV for his master s thesis as well as from the Society of Financial and Economic Mathematics of Braunschweig VBFWM In 2017 he was honored with the teaching award LehrLEO for the best tutorial at TU Braunschweig Since 2020 he holds a position as a postdoctoral researcher at Dartmouth College NH USA
