comprehensive interdisciplinary overview of human plant interactions and their social consequences from the hunter gatherers of the Palaeolithic Era to the 21st century molecular manipulation of crops It links the latest advances in molecular genetics climate research and archaeology to give a new perspective on the evolution of agriculture and complex human societies across the world Even today our technologically advanced societies still rely on plants for basic food needs not to mention clothing shelter medicines and tools This special relationship has tied together people and their chosen plants in mutual dependence for well over 50 000 years Yet despite these millennia of intimate contact people have only domesticated and cultivated a few dozen of the tens of thousands of potentially available edible plants This limited domestication process led directly to the evolution of the complex urban based societies that have dominated much of human development over the past ten millennia Thanks to the latest genomic studies we can now begin to explain how when and where some of the most important crops came to be domesticated and the crucial roles of plant genetics climatic change and social organisation in these processes Indeed it was their unique genetic organisations that ultimately determined which plants eventually became crops rather than any conscious decisions by their human cultivators The book is aimed at a wide audience ranging from plant specialists such as geneticists molecular biologists and agronomists to a more general readership of archaeologists anthropologists historians and others who wish to explore the complex processes that have shaped the often crucial relationships between plants and human societies over the past hundred millennia *Plant by Numbers* Steve
