and Diseased Brain Networks Yong He, Alan Evans, 2015-03-05 An important aspect of neuroscience is to characterize the underlying connectivity patterns of the human brain i.e. human connectomics. Over the past few years, researchers have demonstrated that by combining a variety of different neuroimaging technologies e.g. structural MRI, diffusion MRI, and functional MRI with sophisticated analytic strategies such as graph theory, it is possible to noninvasively map the patterns of structural and functional connectivity of human whole brain networks. With these novel approaches, many studies have shown that human brain networks have nonrandom properties such as modularity, small worldness, and highly connected hubs. Importantly, these quantifiable network properties change with age, learning, and disease. Moreover, there is growing evidence for behavioral and genetic correlates. Network analysis of neuroimaging data is opening up a new avenue of research into the understanding of the organizational principles of the brain that will be of interest for all basic scientists and clinical researchers. Such approaches are powerful, but there are a number of challenging issues when extracting reliable brain networks from various imaging modalities and analyzing the topological properties e.g. definitions of network nodes and edges and reproducibility of network analysis. We assembled contributions related to the state of the art methodologies of brain connectivity and the applications involving development, aging, and neuropsychiatric disorders such as Alzheimer's disease, schizophrenia, attention deficit hyperactivity disorder, and mood and anxiety disorders. It is anticipated that the articles in this Research Topic will provide a greater range and depth of provision for the field of imaging connectomics.

Functional Neuroimaging in Child Psychiatry Monique Ernst, Judith M. Rumsey, 2000-10-12 An authoritative account of clinical and research applications of functional imaging techniques in child psychiatry. [MRI of the Newborn, Part 2, An Issue of Magnetic Resonance Imaging Clinics](#) Thierry A. G. M. Huisman, Claudia M. Hillenbrand, 2012-02-28 Vast experience has been gained over the past decade in safely transporting, monitoring, and imaging neonates, a highly vulnerable patient group. Technological advances in MRI hardware such as higher field strength systems, multi-channel coils, higher gradient performance, and MR-compatible incubators with integrated antennae laid the ground for more detailed, higher resolution anatomical MR imaging. This issue provides separate reviews on the use of MR imaging in the evaluation of encephalopathy, postmortems, spinal dysraphia, and inflicted brain injury, as well as neonatal neuro-MR imaging and MR-guided cardiovascular interventions.
