Conservation Palaeobiology of Marine Ecosystems R. Nawrot, S. Dominici, A. Tomašových, M. Zuschin, 2023-07-03 Conservation palaeobiology tracks the history of ecosystems based on the fossil record to guide conservation decisions and contribute to the theoretical foundations of conservation biology The accelerating pace of global change requires better understanding of the long term resilience and adaptive capacities of ecosystems Fossil assemblages in outcrops and cores together with surface accumulations of skeletal remains represent unique archives of past ecosystem

dynamics and baseline community states prior to anthropogenic impacts. However, as biological data retrieved from fossil and death assemblages cannot be treated in isolation, conservation palaeobiology integrates palaeontological and geological tools to account for the nature of the stratigraphic record. This volume brings together studies that demonstrate how combining marine palaeoecological records with other types of geohistorical data (taphonomic, sedimentological, geochronological, geochemical) can inform biodiversity conservation and ecosystem management. The papers highlight novel approaches and challenges in applying geohistorical data to conservation problems, discuss the limitations imposed by time averaging, and offer both deep and near time perspectives on conservation palaeobiology of marine ecosystems.
