Abstract This thesis discusses the use of the real numbers in theorem proving Typically theorem provers only support a few discrete datatypes such as the natural numbers However the availability of the real numbers opens up many interesting and

important application areas such as the verification of floating point hardware and hybrid systems It also allows the formalization of many more branches of classical mathematics which is particularly relevant for attempts to inject more rigour into computer algebra systems Our work is conducted in a version of the HOL theorem prover We describe the rigorous definitional construction of the real numbers using a new version of Cantor's method and the formalization of a significant portion of real analysis We also describe an advanced derived decision procedure for the Tarski subset of real algebra as well as some more modest but practically useful tools for automating explicit calculations and routine linear arithmetic reasoning Finally we consider in more detail two interesting application areas We discuss the desirability of combining the rigour of theorem provers with the power and convenience of computer algebra systems and explain a method we have used in practice to achieve this We then move on to the verification of floating point hardware After a careful discussion of possible correctness specifications we report on two case studies one involving a transcendental function We aim to show that a theory of real numbers is useful in practice and interesting in theory and that the LCF style of theorem proving is well suited to the kind of work we describe We hope also to convince the reader that the kind of mathematics needed for applications is well within the abilities of current theorem proving technology
