**Magnetoelectric Response in Low-Dimensional Frustrated Spin Systems** Shinichiro Seki, 2012-08-27 Electric control of magnetic properties or inversely magnetic control of dielectric properties in solids is called a magnetoelectric effect and has long been investigated from the point of view of both fundamental physics and potential application Magnetic and dielectric properties usually show minimal coupling but it recently has been discovered that magnetically induced ferroelectricity in some spiral magnets enables remarkably large and versatile magnetoelectric responses To stabilize such helimagnetism magnetic frustration competition between different magnetic interactions is considered the key In the present work two of the most typical frustrated spin systems triangular lattice antiferromagnets and edge shared chain magnets have systematically been investigated Despite the crystallographic simplicity of target systems rich magnetoelectric responses are ubiquitously observed The current results published here offer a useful guideline in the search for new materials with unique magnetoelectric functions and also provide an important basis for a deeper understanding of magnetoelectric phenomena in more complex systems

*Low-Dimensional Systems: Theory, Preparation, and Some Applications* Luis M. Liz-Marzán, Michael Giersig, 2012-12-06 This volume contains papers presented at the NATO Advanced Research Workshop ARW Dynamic Interactions in Quantum Dot Systems held at Hotel Atrium in Puszczkowo near Poznan Poland May 16 19 2002 The term low dimensional systems which is used in the title of this volume refers to those systems which contain at least one dimension that is intermediate between those characteristic of atoms molecules and those of the bulk material Depending on how many dimensions lay within this range we generally speak of quantum wells quantum wires and quantum dots As such an intermediate state some properties of low dimensional systems are very different to those of their molecular and bulk counterparts These properties generally include optical electronic and magnetic properties and all these are partially covered in this book The main goal of the workshop was to discuss the actual state of the art in the broad area of nanotechnology The initial focus was on the innovative synthesis of nanomaterials and their properties such as quantum size effects superparamagnetism or field emission These topics lead us into the various field based interactions including plasmon magnetic spin and exciton coupling The newer more sophisticated methods for characterization of nanomaterials were discussed as well as the methods for possible industrial applications In general chemists and physicists as well as experts on both theory and experiments on nanosized regime structures were brought together to discuss the general phenomena underlying their fields of interest from different points of view

Arrott, 2013-03-09 This work represents the account of a NATO Advanced Research Workshop on Thin Film Growth Techniques for Low Dimensional Structures held at the University of Sussex Brighton England from 15 19 Sept 1986 The objective of the workshop was to review the problems of the growth and characterisation of thin semiconductor and metal layers Recent advances in deposition techniques have made it possible to design new material which is based on ultra thin layers and this is now posing challenges for scientists technologists and engineers in the assessment and utilisation of such new material Molecular beam epitaxy MBE has become well established as a method for growing thin single crystal layers of semiconductors Until recently MBE was confined to the growth of III V compounds and alloys but now it is being used for

group IV semiconductors and II VI compounds Examples of such work are given in this volume MBE has one major advantage over other crystal growth techniques in that the structure of the growing layer can be continuously monitored using reflection high energy electron diffraction RHEED This technique has offered a rare bonus in that the time dependent intensity variations of RHEED can be used to determine growth rates and alloy composition rather precisely Indeed a great deal of new information about the kinetics of crystal growth from the vapour phase is beginning to emerge

**Band-Ferromagnetism** K. Baberschke, M. Donath, W. Nolting, 2008-01-11 The fascinating phenomenon ferromagnetism is far from being fully understood although it surely belongs to the oldest problems of solid state physics For any investigation it appears recommendable to distinguish between materials whose spontaneous magnetization stems from localized electrons of a partially filled atomic shell and those in which it is due to itinerant electrons of a partially filled conduction band In the latter case one speaks of band ferromagnetism prototypes of which are the classical ferromagnets Fe Co and Ni The present book is a status report on the remarkable progress that has recently been made towards a microscopic understanding of band ferromagnetism as an electron correlation effect The authors of the various chapters of this book Band Ferromagnetism Ground State and Finite Temperature Phenomena participated as selected participants in the 242nd WE Heraeus Seminar 4-6 October 2000 held under almost the same title in Wandlitz near Berlin Germany It was the second seminar of this type in Wandlitz The first in 1998 dealt with the complementary topic of the physics of local moment ferromagnets such as Gd Twenty six invited speakers from ten different countries together with fifty five further participants who presented contributions in form of posters spent three days together discussing in an enthusiastic and fertile manner the hot topics of band ferromagnetism

Gijs, 1997-12-18 The Symposium on Magnetic Ultrathin Films Multilayers and Surfaces hosted by the European Materials Research Society was held at the Palais de la Musique et des Congrès in Strasbourg France on June 4-7 1996 Its central theme was the relationship of magnetic properties and device performance to structure at the nano and micrometer length scale Research on the magnetism of surfaces ultrathin films and multilayers has increased dramatically during recent years This development was triggered by the discovery of coupling between ferromagnetic layers across nonmagnetic spacer layers and of the giant magnetoresistance effect in systems of reduced dimension using various micro and nanofabrication techniques has become a subject of special interest It is certainly the promising application potential of these effects in new magnetic recording device geometries which causes this intensive research which is done both by companies and at universities and research institutes A selection of invited and contributed papers presented at the Symposium and accepted for publication is contained in this volume The contents of these proceedings are organized into seven sections A Nanowires Nanoparticles Nanostructuring B Ultrathin Films and Surfaces Characterization C Giant Magnetoresistance D Coupling Tunneling E Growth Structure Magnetism F Growth Structure Magnetoresistance G Coupling Magnetic processes Magneto optics The first four sections contain invited and oral contributed papers in the listed research domains while the last three sections contain the contributions presented during three large poster sessions      **Frontiers of High Pressure Research II: Application of High Pressure to Low-Dimensional Novel Electronic Materials** Hans D. Hochheimer, Bogdan Kuchta, Peter K. Dorhout, Jeffery L. Yarger, 2012-12-06 In recent interactions with industrial companies it became quite obvious that the search for new materials with strong anisotropic properties are of paramount importance for the development of new advanced electronic and magnetic devices The questions concerning the tailoring of materials with large anisotropic electrical and thermal conductivity were asked over and over again It became also quite clear that the chance to answer these questions and to find new materials which have these desired properties would demand close collaborations between

scientists from different fields Modern techniques of controlled materials synthesis and advances in measurement and modeling have made clear that multiscale complexity is intrinsic to complex electronic materials both organic and inorganic A unified approach to classes of these materials is urgently needed requiring interdisciplinary input from chemistry materials science and solid state physics Only in this way can they be controlled and exploited for increasingly stringent demands of technology The spatial and temporal complexity is driven by strong often competing couplings between spin charge and lattice degrees of freedom which determine structure function relationships The nature of these couplings is a sensitive function of electron electron electron lattice and spin lattice interactions noise and disorder external fields magnetic optical pressure etc and dimensionality In particular these physical influences control broken symmetry ground states charge and spin ordered ferroelectric superconducting metal insulator transitions and excitations with respect to broken symmetries created by chemical or photo doping especially in the form of polaronic or excitonic self trapping
