Numerical Ecology P. Legendre, Louis Legendre, 2012-08-06 This volume describes and discusses the numerical methods which are successfully being used for analysing ecological data These methods are derived from the fields of mathematical physics parametric and nonparametric statistics information theory numerical taxonomy archaeology psychometry sociometry and others

Numerical Ecology with R Daniel Borcard, François Gillet, Pierre Legendre, 2018-03-19 This new edition of *Numerical Ecology with R* guides readers through an applied exploration of the major methods of multivariate data analysis as seen through the eyes of three ecologists It provides a bridge between a textbook of numerical ecology and the implementation of this discipline in the R language The book begins by examining some exploratory approaches It proceeds logically with the construction of the key building blocks of most methods i e association measures and matrices and then submits example data to three families of approaches clustering ordination and canonical ordination The last two chapters make use of these methods to explore important and contemporary issues in ecology the analysis of spatial structures and of community diversity The aims of methods thus range from descriptive to explanatory and predictive and encompass a wide variety of approaches that should provide readers with an extensive toolbox that can address a wide palette of questions arising in contemporary multivariate ecological analysis The second edition of this book features a complete revision to the R code and offers improved procedures and more diverse applications of the major methods It also highlights important changes in the methods and expands upon topics such as multiple correspondence analysis principal response curves and co correspondence analysis New features include the study of relationships between species traits and the environment and community diversity analysis This book is aimed at professional researchers practitioners graduate students and teachers in ecology environmental science and engineering and in related fields such as oceanography molecular ecology agriculture and soil science who already have a background in general and multivariate statistics and wish to apply this knowledge to their data using the R language as well as people willing to accompany their disciplinary learning with practical applications People from other fields e g geology geography paleoecology phylogenetics anthropology the social and education sciences etc may also benefit from the materials presented in this book Users are invited to use this book as a teaching companion at the computer All the necessary data files the scripts used in the chapters as well as extra R functions and packages written by the authors of the book are available online URL <http://adn.biol.umontreal.ca/numeralecology/numecolR>

Developments in Numerical Ecology Pierre Legendre, Louis Legendre, 2013-06-29 From earlier ecological studies it has become apparent that simple univariate or bivariate statistics are often inappropriate and that multivariate statistical analyses must be applied Despite several difficulties arising from the application of multivariate methods community ecology has acquired a mathematical framework with three consequences it can develop as an exact science it can be applied operationally as a computer assisted science to the solution of environmental problems and it can exchange information with

other disciplines using the language of mathematics This book comprises the invited lectures as well as working group reports on the NATO workshop held in Roscoff France to improve the applicability of this new method numerical ecology to specific ecological problems

Numerical Ecology P. Legendre, Louis Legendre, 2012-07-21 The book describes and discusses the numerical methods which are successfully being used for analysing ecological data using a clear and comprehensive approach These methods are derived from the fields of mathematical physics parametric and nonparametric statistics information theory numerical taxonomy archaeology psychometry sociometry econometry and others An updated 3rd English edition of the most widely cited book on quantitative analysis of multivariate ecological data Relates ecological questions to methods of statistical analysis with a clear description of complex numerical methods All methods are illustrated by examples from the ecological literature so that ecologists clearly see how to use the methods and approaches in their own research All calculations are available in R language functions

Numerical Ecology P. Legendre, Loic F J Legendre, 1998-11-25 The book describes and discusses the numerical methods which are successfully being used for analysing ecological data using a clear and comprehensive approach These methods are derived from the fields of mathematical physics parametric and nonparametric statistics information theory numerical taxonomy archaeology psychometry sociometry econometry and others Compared to the first edition of Numerical Ecology this second edition includes three new chapters dealing with the analysis of semiquantitative data canonical analysis and spatial analysis New sections have been added to almost all other chapters There are sections listing available computer programs and packages at the end of several chapters As in the previous English and French editions there are numerous examples from the ecological literature and the choice of methods is facilitated by several synoptic tables

Participatory Modelling for Resilient Futures, 2017-11-13 Participatory Modelling for Resilient Futures Action for Managing Our

Environment from the Bottom Up Volume One provides an important contribution to environmental management by introducing an integrative framework for participatory research for better land use and natural resource planning organized around compelling recent case studies. It is a valuable guide for the increasing number of students looking for solutions in sustainability science and also practitioners who are on the ground working with local communities to improve specific places. The book was developed in response to the need to provide a clear and synthetic account in accessible and non-technical language of the way in which innovative integrative research can help solve real world human environment interaction problems at a range of levels and scales e.g. participatory modelling to secure a sustainable future for a natural protected area working with stakeholders to break the deadlock on renewable energy implementation in Europe or tackling social exclusion and reducing food carbon footprint through local agroecology schemes. Makes modeling approaches accessible so environmental and natural resource managers can make more precise decisions accounting for a positive and negative impacts of ecosystem changes. Provides recent real cases to demonstrate implementation of the concepts allowing the reader to see how to bridge scientific research and societal needs in order to effectively translate knowledge into action. Provides an integrated perspective incorporating science politics and society as well as a toolbox of methodologies to enhance participation and engagement of key stakeholders.

The Water-Energy-Food Nexus Brenda Cansino-Loeza, José María Ponce-Ortega, 2023-11-03. The Water Energy Food Nexus Optimization Models for Decision Making covers the discussion about water energy and food as a crucial resource for human well being and for sustainable development. These resources are inextricable interrelated therefore to cover water energy and food demands in different sectors and at different scales it must be considered several sources to produce resources even conventional or unconventional and there must be considered the interlinkages of resources for a proper integration. This book will emphasize several issues that must be considered in the design of water energy food nexus systems such as the selection of technologies to produce water or energy size of technologies and food required to cover nutritional demands. Therefore in The Water Energy Food Nexus Optimization Models for Decision Making mathematical models are presented for the design of water energy food nexus systems involving several strategies to account for issues like sustainable development security of resources interest in conflicts from stakeholders and efficient allocation of resources. Includes different optimization models for the integration of water energy food nexus. Considers sustainability criteria in the presented models. Helps readers understand different approaches for trade off solutions. Presents general software that can be used in solving different problems.

Models of the Ecological Hierarchy, 2012-12-31. In the application of statistics to ecological inference problems hierarchical models combine explicit models of ecological system structure or dynamics with models of how ecological systems are observed. The principles of hierarchical modeling are applied in this book to a wide range of problems ranging from the molecular level through populations ecosystems landscapes networks through to the global ecosphere. Provides an excellent introduction to

modelling Collects together in one source a wide range of modelling techniques Covers a wide range of topics from the molecular level to the global ecosphere
