Plasticity in insulin producing cells cells of the pancreas is a major contributor to metabolic control Targeted regeneration of pancreatic cells for the reversal of diabetes by optimizing cells mass and proliferation to meet metabolic requirements and counter autoimmune response is still a theoretical intervention This monograph reviews the biology ontogeny capabilities and present practical limitations of cell plasticity Relevant biochemical pathways are described with the inclusion of information about how they change with aging during pregnancy and with diet Readers will learn the following key aspects about cell plasticity current knowledge of pancreatic cells development and how cell mass and proliferation change throughout the human lifespan the mechanisms responsible for cell plasticity based on animal models and clinical studies revealing environmental epigenetic endocrine and paracrine regulators the therapeutic potential of resident stem cells within the pancreas bone marrow and cell progenitors This monograph is essential reading for researchers interested in updated knowledge about the molecular and cellular biology of cells in the quest to find a reliable therapy for diabetes **Insulin and IGFs**, 2009-03-10 First published in 1943 Vitamins and Hormones is the

Longest running series published by Academic Press Contributions by leading international authorities **Nutrients and Oxidative Stress: Biochemistry Aspects and Pharmacological Insights** Bee Ling Tan, Mohd Esa Norhaizan, 2024-11-28

Oxidative stress plays a prominent role in the development of numerous human diseases associated with animal based protein high carbohydrate diets and excessive fat consumption Obesity represents the main risk factor for chronic diseases such as cardiovascular disease cancer and type 2 diabetes Extensive research highlights the detrimental impacts of diets high in saturated fat and refined carbohydrates Type 2 diabetes cardiovascular disease and obesity are attributed to the sedentary lifestyles overconsumption of foods high in saturated fats and carbohydrates and the saturation of nutrient storage Indeed the effects of oxidative stress are associated with the absolute quantity and the type of macronutrients both of these aspects contribute to oxidative stress and may favor the development of obesity associated diseases and obesity Nonetheless the underlying mechanisms of nutritionally mediated oxidative stress are complex and poorly understood The literature

reported on nutritionally mediated oxidative stress and the role of diets in oxidative stress induced diseases has not well been compiled in a singular source *Nutrients and Oxidative Stress Biochemistry Aspects and Pharmacological Insights* explores how dietary choices dampen or exacerbate inflammation and oxidative stress The implications of oxidative stress in glucose metabolism and adipocyte and obesity associated non communicable diseases are also discussed in this brief Several issues linked to nutritionally mediated oxidative stress including high carbohydrates high animal based proteins and excessive consumption of fats and oxidative stress and molecular mechanisms of oxidative stress induced diseases are covered The role of diets in oxidative stress induced diseases is also discussed By summarizing all the literature in one place this work provides a cohesive representation of the information and practical reference on the underlying mechanisms of nutritionally mediated oxidative stress involved in the prevention of chronic diseases The work provides a better understanding of the nutritionally mediated oxidative stress and the molecular mechanisms of oxidative stress in the development of chronic diseases and obesity

The Electrophysiology of Neuroendocrine Cells Hans Scherubl, Jurgen Hescheler, 1995-08-21 The *Electrophysiology of Neuroendocrine Cells* explores the role of electrical activity in neuroendocrine cells in stimulus secretion coupling sensory mechanisms and intercellular communication This comprehensive and concise handbook includes introductory material on the ontogenesis and classification of the neuroendocrine system and describes general electrical properties voltage gated ion channels and the pharmacology of ion channels By focusing on functional aspects The *Electrophysiology of Neuroendocrine Cells* provides research scientists physicians and students with a basic understanding of neuroendocrine cells and their similarity to neurones as well as their relationship to thyroid or steroid hormone secreting endocrine cells The multidisciplinary nature of this book provides readers with a broad perspective on the electrical properties of neuroendocrine cells and the combination of general information and specialized information makes the book accessible to beginning and advanced readers alike

Recent Advances in Growth Research Matthew W. Gillman, Peter D. Gluckman, Ron G. Rosenfeld, 2013 Growth in mammals encompasses several stages from intrauterine growth through infancy and childhood to adolescence Each of these phases is characterized by very specific nutritional molecular and endocrine perspectives which under ideal conditions allow the organism to achieve its genetically programmed growth patterns In this book an international panel of experts addresses these topics in a historical physiological and social perspective The first part investigates the genetic epigenetic molecular and nutritional determinants of intrauterine and postnatal growth Part two deals with non evolutionary changes which occurred in the recent past such as changes in body size in utero during infancy and childhood and during adolescence and the potentially unfavorable consequences of enhanced nutrition and growth including early onset of puberty development of obesity and increases in metabolic and cardiovascular disease The last part addresses the question of which factors define healthy growth in light of the influence of nutritional molecular and endocrine influences Although the association between rapid changes in body size and adverse health effects

is clear the precise nature of causality remains uncertain Presenting the latest scientific findings in growth research this publication provides essential reading for pediatricians clinical investigators and health workers

Habener, Mehboob Hussain, 2012-12-06 Diabetes mellitus is rapidly increasing in prevalence throughout both developed and developing countries The social and economic burden of this disease is estimated to cost 14 billion dollars worldwide In the USA alone 15 million individuals are diabetic nearly half of them unaware of their condition Complications of diabetes mellitus are the leading causes for blindness limb amputation and chronic renal failure and kidney transplantation in industrialized countries Further diabetes mellitus per se and the metabolic derangement associated with diabetes are important risk factors for cardiovascular disease Diabetes as defined by an elevated fasting blood glucose level is presently subdivided in etiologically distinct groups The most prevalent being type 2 adult onset diabetes characterized by insulin resistance and failure of the cell to supply insulin in amounts sufficient to meet the body's needs Type 1 juvenile diabetes most commonly with an onset during childhood and adolescence is caused by an auto immune destruction of the pancreatic cells The causations of both type 1 and type 2 diabetes involve a combination of complex genetic traits and environmental influences A third category are the mature onset diabetes of the young MODY This comparatively small group of patients 10% of diabetes presents relative early in life 30 years of age compared to the more common late onset type 2 diabetes

The Biology of the Pancreatic Cell S.L. Howell, 1999-04-15 As a result of the key advances made more than 30 years ago specifically the ability to isolate islets of Langerhans from the pancreas the ability to measure insulin accurately by immunoassay and the development of microchemical techniques for studying cells and their components many research

volumes symposium reports and original papers have been produced This explosion of interest has probably had at least three stimuli 1 the inherent scientific interest in understanding secretion of the pancreatic cell² the cells relevance to a very common disease³ the availability of funding from specific sources related to diabetes research for instance Juvenile Diabetes Foundation International and the British Diabetic Association As a result of all this activity detailed scientific literature including research reviews are readily available Surprisingly enough there are relatively few attempts to summarize this great bulk of knowledge in a way that is accessible to the newcomer to this field and this book is intended to bridge this gap

Progress in Understanding Cystic Fibrosis Dinesh Sriramulu, 2017-07-12 Congenital defects in humans are of greater concern and in that line cystic fibrosis CF has been one of the most complex diseases posing treatment challenge till date Though it is a chronic condition CF is closely associated with dysfunction of various organ systems of the human body which in turn results in secondary infections by microbes Decades of research by scientists worldwide has narrowed down the cause of CF to a single target gene But the complexity of the disease is the prime impediment to finding a single shot cure Fortunately the multidisciplinary approach toward understanding and management of the CF condition has certainly increased the level of life expectancy among CF patients In particular the omics and the systems biology approach have greatly widened the focal area for better understanding of the disease This book includes a collection of interesting chapters contributed by eminent scientists around the world who have been striving to improve the life of those affected by CF

Nutrient Regulation during Pregnancy, Lactation, and Infant Growth Lindsay Allen, Janet King, Bo Lönnerdal, 2013-11-22 Almost every aspect of energy and nutrient metabolism is altered by hormonal and other physiological changes during pregnancy and lactation While it is evident that hormonal adjustments affect nutrient requirements these are rarely considered when nutrient recommendations are made for pregnant or lactating women and often neglected during evaluation of nutritional status In addition changes in nutrient metabolism during the stages of pregnancy and of lactation are usually considered separately while in reality events during pregnancy can have a major influence on nutritional status and nutrient requirements during lactation The purpose of this volume is to describe changes in the metabolism of important nutrients during pregnancy and lactation including the physiological basis for these changes and their implications for nutrient requirements and assessment Authors have considered such issues as inter relationships between endocrine changes and nutrient metabolism at the tissue cellular and molecular level alterations in nutrient binding proteins the efficiency of nutrient absorption and retention and the impact on maternal as well as fetal nutritional status Another unique aspect of this book is the focus on pregnancy and lactation as a continuum **Fetal and Neonatal Physiology E-Book** Richard Polin, Steven H.
