Random Coefficient Models Nicholas T. Longford, 1995 Random Coefficient Models in Econometrics John W. Henderson, 1976 **Random Coefficient Models** P. A. V. B. Swamy, 1993 **Statistical Inference in Random Coefficient Regression Models** P.A.V.B. Swamy, 2012-12-06

This short monograph which presents a unified treatment of the theory of estimating an economic relationship from a time series of cross sections is based on my Ph D dissertation submitted to the University of Wisconsin Madison To the material developed for that purpose I have added the substance of two subsequent papers Efficient methods of estimating a regression equation with equi correlated disturbances and The exact finite sample properties of estimators of coefficients in error components regression models with Arora which form the basis for Chapters 11 and III respectively One way of increasing the amount of statistical information is to assemble the cross sections of successive years To analyze such a body of data the traditional linear regression model is not appropriate and we have to introduce some additional complications and assumptions due to the heterogeneity of behavior among individuals These complications have been discussed in this monograph Limitations of economic data particularly their non experimental nature do not permit us to know a priori the correct specification of a model I have considered several different sets of assumptionR about the stability of coefficients and error variances across individuals and developed appropriate inference procedures I have considered only those sets of assumptions which lead to operational procedures Following the suggestions of Kuh Klein and Zellner I have adopted the linear regression models with some or all of their coefficients varying randomly across individuals

Identification and Estimation of 'irregular' Correlated Random Coefficient Models Bryan S. Graham, James Powell, 2008 In this paper we study identification and estimation of the causal effect of a small change in an endogenous regressor on a continuously valued outcome of interest using panel data We focus on the average partial effect APE over the full population distribution of unobserved heterogeneity e g Chamberlain 1984 Blundell and Powell 2003 Wooldridge 2005a In our basic model the outcome of interest varies linearly with a scalar regressor but with an intercept and slope coefficient that may vary across units and over time in a way which depends on the regressor This model is a special case of Chamberlain s 1980b 1982 1992a correlated random coefficients CRC model but not does not satisfy the regularity conditions he imposes Irregularity while precluding estimation at parametric rates does not result in a loss of identification under mild smoothness conditions We show how two measures of the outcome and regressor for each unit are sufficient for identification of the APE as well as aggregate time trends We identify aggregate trends using units with a zero first difference in the regressor or in the language of Chamberlain 1980b 1982 stayers and the average partial effect using units with non zero first differences or movers We discuss extensions of our approach to models with multiple regressors and more than two time periods We use our methods to estimate the average elasticity of calorie consumption with respect to total outlay for a sample of poor Nicaraguan households cf Strauss and Thomas 1995 Subramanian and Deaton 1996 Our CRC

average elasticity estimate declines with total outlay more sharply than its parametric counterpart

Random Coefficient Autoregressive Models: An Introduction D.F. Nicholls, B.G. Quinn, 2012-12-06 In this monograph we have considered a class of autoregressive models whose coefficients are random The models have special appeal among the non linear models so far considered in the statistical literature in that their analysis is quite tractable It has been possible to find conditions for stationarity and stability to derive estimates of the unknown parameters to establish asymptotic properties of these estimates and to obtain tests of certain hypotheses of interest We are grateful to many colleagues in both Departments of Statistics at the Australian National University and in the Department of Mathematics at the University of Wollongong Their constructive criticism has aided in the presentation of this monograph We would also like to thank Dr M A Ward of the Department of Mathematics Australian National University whose program produced after minor modifications the three dimensional graphs of the log likelihood functions which appear on pages 83 86 Finally we would like to thank J Radley H Patrikka and D Hewson for their contributions towards the typing of a difficult manuscript

Random Coefficient Models for Complex Longitudinal Data, 2014 **Identification and Estimation of Categorical Random Coefficient Models** Zhan Gao, M. Hashem Pesaran, 2022 This paper proposes a linear categorical random coefficient model in which the random coefficients follow parametric categorical distributions The distributional parameters are identified based on a linear recurrence structure of moments of the random coefficients A Generalized Method of Moments estimator is proposed and its finite sample properties are examined using Monte Carlo simulations The utility of the proposed method is illustrated by estimating the distribution of returns to education in the U S by gender and educational levels We find that rising heterogeneity between educational groups is mainly due to the increasing returns to education for those with postsecondary education whereas within group heterogeneity has been rising mostly in the case of individuals with high school or less education

Harry H. Kelejian, Scott W. Stephan, University of Maryland. Department of Economics, 1984 Changing and Random Coefficient Models Jozef Zbigniew Dziechciarz, 2016 This chapter contains a survey of various econometric model formulations in which it is assumed that coefficients vary across time Depending on the accepted parameter variation structure one may classify such models into two main groups models with variable but non stochastic parameter and models with randomly varying coefficients The latter group consists of two types models where coefficients are generated from stationary and models in which coefficients are generated from non stationary stochastic processes Ali three groups are surveyed Several representative models from each group are shown with special emphasis on estimation testing the specification and possible fields of implementation Justification for the various model formulations is given A detailed list of references ends the survey **Testing the Correlated Random Coefficient Model** James J. Heckman, 2009 The recent literature on instrumental variables IV features models in which agents sort into treatment status on the basis of gains from treatment as well as on baseline pretreatment levels Components of the gains known to the agents and acted on by them may not be known by the observing economist Such models are called correlated random coefficient models Sorting on unobserved components of gains complicates the interpretation of what IV estimates This paper examines testable implications of the hypothesis that agents do not sort into treatment based on gains In it we develop new tests to gauge the empirical relevance of the correlated random coefficient model to examine whether the additional complications associated with it are required We examine the power of the proposed tests We derive a new representation of the variance of the instrumental variable estimator for the correlated random coefficient model We apply the methods in this paper to the prototypical empirical problem of estimating the return to schooling and find evidence of sorting into schooling based on unobserved components of gains **Estimating Random Effects and Serial Correlation in Random Coefficient**
