Dilute Nitride Semiconductors Mohamed Henini, 2004-12-15 This book contains full account of the advances made in the dilute nitrides providing an excellent starting point for workers entering the field It gives the reader easier access and better evaluation of future trends Conveying important results and current ideas Includes a generous list of references at the end of each chapter providing a useful reference to the III V N based semiconductors research community The high speed lasers operating at wavelength of 1.3 μm and 1.55 μm are very important light sources in optical communications since the optical fiber used as a transport media of light has dispersion and attenuation minima respectively at these wavelengths These long wavelengths are exclusively made of InP based material InGaAsP InP However there are several problems with this material system Therefore there has been considerable effort for many years to fabricate long wavelength laser structures on other substrates especially GaAs The manufacturing costs of GaAs based components are lower and the processing techniques are well developed In 1996 a novel quaternary material GaInAsN was proposed which could avoid several problems with the existing technology of long wavelength lasers In this book several leaders in the field of dilute nitrides will cover the growth and processing experimental characterization theoretical understanding and device design and fabrication of this recently developed class of semiconductor alloys They will review their current status of research and development Dilute Nitrides III V Semiconductors Physics and Technology organises the most current available data providing a ready source of information on a wide range of topics making this book essential reading for all post graduate students researchers and practitioners in
