Stay Cool Holger Koch-Nielsen, 2013-06-17  
In hot dry or warm humid climates more than half of the urban peak load of energy consumption is used to satisfy air conditioning demands alone  
Since the urbanization rate in developing countries is extreme the pressure placed on energy resources to satisfy the future requirements of the built environment will be great unless new more cost effective measures can be introduced  
Stay Cool is an essential guide for planning and design using active design principles and passive means to satisfy human comfort requirements specifically in these climate zones based on examples of traditional and modern constructions  
The book demonstrates how a design strategy for urban environments and individual buildings incorporating naturally occurring resources and specific energy efficient technologies can create a location form and structure that promote significant energy savings  
Such strategies can be applied to low cost housing or indeed to any other buildings in order to improve comfort with passive means and low energy budgets  
Following an outline of climatic issues characteristics and thermal comfort requirements the book details the available techniques and technologies that can be used to shape both built and external environments the building envelope material selections and natural ventilation and cooling methods to satisfy both human requirements and the need for energy efficiency  
It also includes an active design checklist and summary of available design checking tools a rehabilitation guide for existing urban building and external environments and solar charts  
Planners architects engineers technicians and building designers will find Stay Cool an inspirational guide and an essential reference when working with planning and design of the built environment in hot dry and warm humid climate zones  
It will also be of benefit to students academics and researchers with an interest in sustainable and energy efficient architecture techniques and practice
