Griffith, 2012-12-06 In recent years there has been a growing interest in and concern for the development of a sound spatial statistical body of theory This work has been undertaken by geographers statisticians regional scientists econometricians and others e g sociologists It has led to the publication of a number of books including Cliff and Ord s *Spatial Processes* 1981 Bartlett s *The Statistical Analysis of Spatial Pattern* 1975 Ripley s *Spatial Statistics* 1981 Paelinck and Klaassen s *Spatial Econometrics* 1979 Ahuja and Schachter s *Pattern Models* 1983 and Upton and Fingleton s *Spatial Data Analysis by Example* 1985 The first of these books presents a useful introduction to the topic of spatial autocorrelation focusing on autocorrelation indices and their sampling distributions The second of these books is quite brief but nevertheless furnishes an eloquent introduction to the relationship between spatial autoregressive and two dimensional spectral models Ripley s book virtually ignores autoregressive and trend surface modelling and focuses almost solely on point pattern analysis Paelinck and Klaassen s book closely follows an econometric textbook format and as a result overlooks much of the important material necessary for successful spatial data analysis It almost exclusively addresses distance and gravity models with some treatment of autoregressive modelling *Pattern Models* supplements Cliff and Ord s book which in combination provide a good introduction to spatial data analysis Its basic limitation is a preoccupation with the geometry of planar patterns and hence is very narrow in scope
