Abstract

In this paper, for arbitrary sufficiently small deformations, the propagation of the acceleration waves in isotropic and homogeneous materials is discussed in the context of second-order elasticity by using a perturbation method. This method allows us to determine the first-order terms of the speeds as well as the amplitudes both of the principal waves and the waves in any arbitrary direction of propagation, when the undisturbed region is subjected to an arbitrary deformation. Finally, some numerical results are presented in some conventional Mooney-Rivlin materials.

Keywords: Acceleration waves, nonlinear elasticity, perturbation method, second-order effects, principal waves.

AMS Subject Classification: 74B20, 74J30

1. Introduction.

The study of the propagation of acceleration waves in nonlinear, elastic, isotropic, and homogeneous media, has been, and remains, a topic of great interest in many areas of the physical sciences. However, general results in finite elasticity have only been obtained for *principal waves*, i.e., for the ordinary waves which propagate along the *principal axes of strain* (see [1], [2] which contain detailed references to other contributions). These waves, when they exist, can only be longitudinal or transverse, and if the form of the stress relation is known, then *Ericksen's formulae* supply the unique value of their speeds. Conversely, if these speeds are known functions of the three principal stretches, for example by experiments, then the response coefficients are uniquely determined. All that supplies the first simple and definite connection between the existence of principal waves and physically reasonable static response of an elastic isotropic material in finite deformations (see [1] p.278-294).

The author's forty-year professional career and academic life journey is first briefly sketched in Chapter 1 and more details are elaborated in three chapters that follow Chapter 2. The first ten years at Lehigh beginning to show Chapter 3. Twenty-three years at Purdue the highly productive years and Chapter 4 seven years at UH the pursuit of excellence. The author's specific academic contributions are documented in the following three chapters Chapter 5. 23 academic bulletins are selected to highlight his 10 major research areas Chapter 6. 23 Academic masterpiece books are listed along with their respective peer review comments and Chapter 7 academic publications include journal articles conference proceedings and symposiums and lectures and keynotes. Stronge, Tongxi Yu, 2012-12-06 Our topic is irreversible or plastic deformation of structural elements composed of

relatively thin ductile materials These deformations are commonly used in sheet metal forming operations to produce lightweight parts of any particular shape In another context this type of plastic deformation is described as impact damage in the case of structural components involved in collision Here we are concerned with mechanics of both static and dynamic deformation processes The purpose is to use typical material properties and structural characteristics to calculate the deformation for certain types of load in particular to find the final deflection and shape of the deformed structure and to illustrate how the development of this final shape depends on the constitutive model used to represent the material behavior The major issue to be addressed is which structural and constitutive properties are important for calculating response to either static or brief but intense dynamic loads Furthermore how do the results of various constitutive models compare with observed behavior
