Technology-Based Regional Economic Development Akio Nishizawa, David V. Gibson, 2024-10-08 Regional technology based economic

development and the recruitment and retention of talent is a top priority of city regions in the United States and in countries around the world. However, policy recommendations from government officials, industry leaders, and academics are often ambiguous or are in conflict. To address these issues, this book deals with the complex intersection of institutional theory and national and regional policy initiatives. It provides an overview of United States and Japanese technology policy development at the national level with case analyses of Austin, Texas, and Tsukuba, Japan, to identify key regional strategies and processes that have resulted in successful endogenous technology-based business development and job creation. It offers an innovative analytical perspective to improve our understanding of how successful tech-based regional economic development works in theory and practice. The book's discussion is grounded on important technology paradigm shifts in the US and Japan from 1970 to 1980, leading to current realities. To address the complex puzzle of the space conundrum, the authors describe similarities and differences in regional development processes in Austin and Tsukuba. They present a generalizable model indicating necessary and sufficient conditions linked to the building of new small institutions at normative and cognitive levels of analysis in consort with regulative policy and innovations at the macro level. Capital institutions. The book clearly explains the relations between institutions and economic growth, an important issue in contemporary economics. The book's conclusions clarify critical success factors for endogenous regional development, growth theory, and lead to recommendations for policymakers who are searching for ways to achieve success.

Gibson,2011-01-01 As we move further into the 21st century increasing emphasis is being placed on the importance of technology transfer Through new research and practices scholars practitioners and policymakers have made great strides in broadening our understanding and ability to implement technology transfer and commercialization processes The fruit of that research is collected in this timely volume Technology transfer is a dynamic area of study that examines traditional topics such as intellectual property management the management of risk market identification the role of public and private labs and the role of universities This volume reflects on how government business and academia influence technology transfer in different countries and how the infrastructure of a country enhances technology and contributes to each country s overall economy Interpreting and adopting the processes of technology transfer and commercialization or building innovative ecosystems is critical to seeing success in this digital age Those leading the surge toward building innovative ecosystems for technology transfer are the fellows of the Institute for Innovation Creativity and Capital IC2 Institute at The University of Texas at Austin Global in its scope of solving market economy problems for this volume the Institute has focused its lens on accelerated knowledge based development Here scholars from 13 countries come together to critique technology transfer from each of their respective nations The results of their contributions lend innovative insight to exactly how different nations are working to maximize technology transfer and commercialization in uncertain times Those with an interest in commercialization and technology transfer from students to scholars practitioners to policymakers will find this important collection of great value **The Long Arm of Moore's Law** Cyrus C. M. Mody,2016-12-02 How beginning in the mid 1960s the US semiconductor industry helped shape changes in American science including a new orientation to the short term and the commercial Since the mid 1960s American science has undergone significant changes in the way it is organized funded and practiced These changes include the decline of basic research by corporations a new orientation toward the short term and the commercial with pressure on universities and government labs to participate in the market and the promotion of interdisciplinarity In this book Cyrus Mody argues that the changes in American science that began in the 1960s co evolved with and were shaped by the needs of the civilianized US semiconductor industry In 1965 Gordon Moore declared that the most profitable number of circuit components that can be crammed on a single silicon chip doubles every year Mody views Moore s Law less as prediction than as self fulfilling prophecy pointing to the enormous investments of capital people and institutions the semiconductor industry required the long arm of Moore s Law that helped shape all of science Mody offers a series of case studies in microelectronics that illustrate the reach of Moore s Law He describes the pressures on Stanford University s electrical engineers during the Vietnam era IBM s exploration of alternatives to semiconductor technology the emergence of consortia

to integrate research across disciplines and universities and the interwoven development of the the molecular electronics community and associated academic institutions as the vision of a molecular computer informed the restructuring of research programs

Creating Value with Science and Technology Eliezer Geisler, 2001-08-30 Do science and technology create value for society and the economy and how might one go about measuring it How do we evaluate its benefits Can we even be certain that there are benefits Geisler argues that there are benefits and that they outweigh in value the negative impacts that inevitably accompany them His revolutionary new book goes on to show that they can also be measured and

evaluated and in one volume all of the existing knowledge on how to do it is compiled then Geisler's own methods are offered. The result is a compelling argument that the value of science and technology in our lives has indeed been positive and that the economic well-being of all individuals, organizations and nations rests upon them. Geisler starts off by describing his conceptual framework for the evaluation of science and technology and the impact and benefits that proceed from them. He discusses the nature of evaluation in general terms and then in the specific context of science, technology and innovation together. He reviews the state of our present knowledge and assesses the nature of value creation itself. Throughout, Geisler remains fixed on his driving thesis. Although there are certainly some negative impacts from science and technology on the whole, the results of its outputs are positive. He shows how they have contributed to a range of activities and institutions, particularly to the improvement of health and human welfare worldwide. Finally, after discussing the theories of evaluation, he gets down to the practice, providing readers with a way to assess science and technological innovations for themselves.

Net Loss Nathan Newman, 2010-11-01 Newman first tells the story of the US federal government's crucial role in the early development of the internet with the promotion of open computer standards and collaborative business practices that became the driving force of the Silicon Valley model. He then examines the complex dynamic of the process whereby regional economies have been changing as business alliances built around industries like the internet replace the broader public investments that fuelled regional growth in the past. A radical restructuring of once regionally focused industries like banking, electric utilities and telephone companies is under way with changes in federal regulation helping to undermine regional planning and the power of local community actors.

Transformation to Agility Jeffrey Amos, 2018-01-12 History is replete with examples of one political system replacing another, one scientific discovery invalidating another, and this cycle has occurred repeatedly in the production of goods and products for society. This book, first published in 1998, examines the massive transition currently taking place: the decline of the system of mass manufacturing. Various global changes in American business and manufacturing have forced a review of accepted thinking, and this book is a key text in this evaluation.

Growing a Japanese Science City James W. Dearing, 2002-09-11 Tsukuba Science City is the world's most ambitious attempt to turbocharge scientific collaboration. James W. Dearing looks at the political and economic context within which the plans for Tsukuba were laid, how those plans changed during the process of implementation, and at the functioning of Tsukuba today. Tsukuba is vitally important to Japan's basic scientific research. Its history, its failures and successes need to be understood by governments and businesses planning for scientific research and economic growth.
