Randomization, Masking, and Allocation Concealment Vance Berger, 2017-10-30 Randomization Masking and Allocation Concealment is indispensable for any trial researcher who wants to use state of the art randomization methods and also wants to be able to describe these methods correctly Far too often the subtle nuances that distinguish proper randomization from flawed randomization are completely ignored in trial reports that state only that randomization was used with no additional information Experience has shown that in many cases the type of randomization that was used was flawed It is only a matter of time before medical journals and regulatory agencies come to realize that we can no longer rely on or publish flawed trials and that flawed randomization in and of itself disqualifies a trial from being robust or high quality even if that trial is of high quality otherwise This book will help to clarify the role randomization plays in ensuring internal validity and in drawing valid inferences from the data The various chapters cover a variety of randomization methods and are not limited to the most common and most flawed ones Readers will come away with a profound understanding of what constitutes a valid randomization procedure so that they can distinguish the valid from the flawed among not only existing

methods but also methods yet to be developed

**Parallel Algorithms** M H

Alsuwaiyel, 2022-05-30 This book is an introduction to the field of parallel algorithms and the underpinning techniques to realize the parallelization The emphasis is on designing algorithms within the timeless and abstracted context of a high level programming language The focus of the presentation is on practical applications of the algorithm design using different models of parallel computation Each model is illustrated by providing an adequate number of algorithms to solve some problems that quite often arise in many applications in science and engineering The book is largely self contained presuming no special knowledge of parallel computers or particular mathematics In addition the solutions to all exercises are included at the end of each chapter The book is intended as a text in the field of the design and analysis of parallel algorithms It includes adequate material for a course in parallel algorithms at both undergraduate and graduate levels

**Arithmetic and Geometry** Gisbert Wüstholz, Clemens Fuchs, 2019-10-08 Arithmetic and Geometry presents highlights of recent work in arithmetic algebraic geometry by some of the world's leading mathematicians Together these 2016 lectures which were delivered in celebration of the tenth anniversary of the annual summer workshops in Alpbach Austria provide an introduction to high level research on three topics Shimura varieties hyperelliptic continued fractions and generalized Jacobians and Faltings height and L functions The book consists of notes written by young researchers on three sets of lectures or minicourses given at Alpbach The first course taught by Peter Scholze contains his recent results dealing with the local Langlands conjecture The fundamental question is whether for a given datum there exists a so called local Shimura variety In some cases they exist in the category of rigid analytic spaces in others one has to use Scholze's perfectoid spaces The second course taught by Umberto Zannier addresses the famous Pell equation not in the classical setting but rather with the so called polynomial Pell equation where the integers are replaced by polynomials in one variable with complex coefficients which leads to the study of hyperelliptic continued fractions and generalized Jacobians The third course taught by Shou Wu Zhang originates in the Chowla Selberg formula which was taken up by Gross and Zagier to relate values of the L function for elliptic curves with the height of Heegner points on the curves Zhang X Yuan and Wei Zhang prove the Gross Zagier formula on Shimura curves and verify the Colmez conjecture on average

**Adaptive Stream Mining** Albert Bifet, 2010 This book is a significant contribution to the subject of mining time changing data streams and addresses the design of learning algorithms for this purpose It introduces new contributions on several different aspects of the problem identifying research opportunities and increasing the scope for applications It also includes an in depth study of stream mining and a theoretical analysis of proposed methods and algorithms The first section is concerned with the use of an adaptive sliding window algorithm ADWIN Since this has rigorous performance guarantees using it in place of counters or accumulators it offers the possibility of extending such guarantees to learning and mining algorithms not initially designed for drifting data Testing with several methods including Naïve Bayes clustering decision trees and ensemble methods is discussed as well The second part of the book describes a formal study of connected acyclic graphs or trees from the point of view of closure based mining presenting efficient algorithms for subtree testing and for mining ordered and unordered frequent closed trees Lastly a general methodology to identify closed patterns in a data stream is outlined This is applied to develop an incremental method a sliding window based method and a method that mines closed trees adaptively from data streams These are used to introduce classification methods for tree data streams
