Jorgensen, Michael Schlüter, Tjeerd C.E. Van Weering, 2013-11-11 Ocean margins are the transitional zones between the oceans and continents They represent dynamic systems in which numerous processes shape the environment and result in impacting the utilization and hazard potentials for humans These processes are influenced by a variety of steering mechanisms from mountain building and climate on the land to tectonics and sea level fluctuations in ocean margins This book examines various aspects of regulation for the long term development of ocean margins of the impact of fluids and of the dynamics of benthic life at and below the seafloor in ocean margin systems **Transactions** Royal Society of New Zealand, 1916 *Carbonate Sedimentology* Maurice E. Tucker, V. Paul Wright, 2009-07-17 Carbonate rocks limestones and dolomites constitute a major part of the geological column and contain not only 60% of the world's known hydrocarbons but also host extensive mineral deposits This book represents the first major review of carbonate sedimentology since the mid 1970s It is aimed at the advanced undergraduate postgraduate level and will also be of major interest to geologists working in the oil industry Carbonate Sedimentology is designed to take the reader from the basic aspects of limestone recognition and classification through to an appreciation of the most recent developments such as large scale facies modelling and isotope geochemistry Novel aspects of the book include a detailed review of carbonate mineralogy non marine carbonate depositional environments and an in depth look at carbonate deposition and diagenesis through geologic time In addition the reviews of individual depositional systems stress a process based approach rather than one centered on simple comparative sedimentology The unique quality of this book is that it contains integrated reviews of carbonate sedimentology and diagenesis within one volume **Sea Management** Adalberto Vallega, 1992-05-07 This book has been conceived with the aim of contributing to the International Conference on Ocean Management in Global Change Genoa June 22-26 1992 and to the ocean sciences debate on the conceptual framework and targets of sea management

Late Quaternary Palaeoceanography of the North Atlantic Margins John T. Andrews, 1996 The focus of this book is on oceanic climate change during the last deglaciation period and the high temporal resolution that can be obtained from

sediment records at continental margin sites The book draws together papers from the north eastern North American continental margin with those from the north west European Arctic and the Arctic and North Atlantic Oceans **World Atlas of Submarine Gas Hydrates in Continental Margins** Jürgen Mienert,Christian Berndt,Anne M. Tréhu,Angelo Camerlenghi,Char-Shine Liu,2022-01-01 This world atlas presents a comprehensive overview of the gas hydrate systems of our planet with contributions from esteemed international researchers from academia governmental institutions and hydrocarbon industries The book illustrates describes and discusses gas hydrate systems their geophysical evidence and their future prospects for climate change and continental margin geohazards from passive to active margins This includes passive volcanic to non volcanic margins including glaciated and non glaciated margins from high to low latitudes Shallow submarine gas hydrates allow a glimpse into the past from the Last Glacial Maximum LGM to modern environmental conditions to predict potential changes in future stability conditions while deep submarine gas hydrates remained more stable This demonstrates their potential for rapid reactions for some gas hydrate provinces to a warming world as well as helping to identify future prospects for environmental research Three dimensional and high resolution seismic imaging technologies provide new insights into fluid flow systems in continental margins enabling the identification of gas and gas escape routes to the seabed within gas hydrate environments where seabed habitats may flourish The volume contains a method section detailing the seismic imaging and logging while drilling techniques used to characterize gas hydrates and related dynamic processes in the sub seabed This book is unique as it goes well beyond the geophysical monograph series of natural gas hydrates and textbooks on marine geophysics It also emphasizes the potential for gas hydrate research across a variety of disciplines Observations of bottom simulating reflectors BSRs in 2D and 3D seismic reflection data combined with velocity analysis electromagnetic investigations and gas hydrate stability zone GHSZ modelling provide the necessary insights for academic interests and hydrocarbon industries to understand the potential extent and volume of gas hydrates in a wide range of tectonic settings of continental margins Gas hydrates control the largest and most dynamic reservoir of global carbon Especially 4D 3D seismic but also 2D seismic data provide compelling sub seabed images of their dynamical behavior Sub seabed imaging techniques increase our understanding of the controlling mechanisms for the distribution and migration of gas before it enters the gas hydrate stability zone As methane hydrate stability depends mainly on pressure temperature gas composition and pore water chemistry gas hydrates are usually found in ocean margin settings where water depth is more than 300 m and gas migrates upward from deeper geological formations This highly dynamic environment may precondition the stability of continental slopes as evidenced by geohazards and gas expelled from the sea floor This book provides new insights into variations in the character and existence of gas hydrates and BSRs in various geological environments as well as their dynamics The potentially dynamic behavior of this natural carbon system in a warming world its current and future impacts on a variety of Earth environments can now be adequately evaluated by using the information

provided in the world atlas This book is relevant for students researchers governmental agencies and oil and gas professionals Some familiarity with seismic data and some basic understanding of geology and tectonics are recommended

Rifts and Passive Margins Michal Nemčok, 2016-03-02 Rifts and passive margins are extremely important for the petroleum industry as they are areas of high sedimentation and can contain significant oil and gas resources This book provides a comprehensive understanding of rifts and passive margins as a whole It synthesises in one volume the existing information devoted to specific aspects of these vitally important hydrocarbon habitats This collection of state of the art information on the topic facilitates the better use of this knowledge to assess the risks of exploring and operating in these settings and the development of systematic and predictive hydrocarbon screening tools The book will be invaluable for a broad range of readers from advanced geology students and researchers to exploration geoscientists to exploration managers exploring for and developing hydrocarbon resources in analogous settings

Glacier-influenced Sedimentation on High-latitude Continental Margins J. A. Dowdeswell, C. Ó Cofaigh, 2002 This book examines the process and patterns of glacier influenced sedimentation on high latitude continental margins and the geophysical and geological signatures of the resulting sediments and landforms It contains a range of papers concerning modern and glacially influenced sedimentation in high latitude areas from both hemispheres many of which discuss the relationship between glacier dynamics and the sediments and landforms preserved in the glacimarine environment
