

**TRANSLATING ADDRESSES**

LOCAL ADDRESS TABLE (LAT) – Created during installation. Defines internal IP address ranges so that local clients requesting an object from an internal server can obtain the object directly from the internal server and bypass the proxy server. Excluding external addresses causes external client requests to internal servers to be blocked. If external addresses are included in the LAT, access to internal resources will be granted to external addresses. Internal requests for those addresses would also bypass the proxy server. Once the LAT is created, it is stored in a file called `local\lat.txt` in the default location `C:\MSDPS\SYSTEM32`. Proxy servers always download the file from this shared directory to keep the client configuration current.

CHOOSING SERVICES

Services can be configured through proxy server. There are two security caching, meaning well since that can be found in the rules of the proxy server. There are three services:

- **COMPATIBLE WITH CERTS** – Proxy protocol
- **HTTP AND FTP CACHING**
- **Service proxying and service forwarding in conjunction with Web publishing**
- **Other level-defined permissions for protocols**
- **Restricted access to the Internet**
- **IP address aggregation**
- **Logged information**

SYNOPSIS PROXY SERVICES

- **Then either TCP/IP or HTTP/HTTPS on the internal network**
- **Microsoft NT Challenge/Response authentication**
- **Compatible with most Windows Sockets 1.1-compatible programs**
- **Controlled network and external access**
- **Restricted access to the Internet**
- **IP address aggregation**
- **Logged information**
- **Client compatibility**

SYNOPSIS PROXY SERVICES

- **Secure communication between client and server**
- **Uses the TCP/IP protocol on the internal network**
- **Supports the Microsoft Proxy Protocol**
- **Compatible with popular operating systems**
- **Logs information about proxy requests**

CONNECTIVITY METHODS

A connectivity method is the protocol the client and server use to communicate across the network. There are two methods:

- **HTTP/HTTPS** – Used primarily in Microsoft Internet networks.
- **Advantages** – Speed, dynamic addressing, existing hardware network, security.
- **Disadvantages** – Protocol limitations; only supports Windows NT, Windows 95, and NT.
- **TCP/IP** – Widely used by almost all platforms.
- **Advantages** – Caching, no protocol limitations, supports all client capability, will work for the default method.
- **Disadvantages** – Address authentication, security.

FAULT TOLERANCE STRATEGY

FAULT TOLERANCE – The ability to provide uninterrupted access to the Internet or network if the proxy server goes down. Used for multi-site networks or networks with more than one connection to the Internet.

ARRAY APPROACH – A group of proxy servers acting as a single logical cluster that result in multiple proxy servers cooperating with each other to avoid interrupted service. Each server maintains a list of servers that are available to it. A request to a proxy server can be forwarded to a proxy server if the server is not available to a cached object. Calculations take place at the proxy server level or at the Internet level. The Internet level is the Internet Explorer.

USING ROUTING – A proxy server function providing fault tolerance in a network path. Affects portions of your network at the Internet. There is only one connection to the Internet network, to a single array. Configuring routing provides a backup network path to the Internet and/or the virtual office of a branch. Supported only by the Proxy Server. Routing can be configured to route client requests to a proxy server regardless of directly to the Internet. A value on the Internet can be a connection path to an HTTP or a standard file.

Handling Requests from Cache**TYPES OF AUTHENTICATION**

There are three types of authentication available with Internet Information Server (IIS). Configure the authentication method that you will use in the WWW service properties page in Internet Service Manager. Authentication is set through the Service tab in the WWW service properties page.

ALLOW ANONYMOUS LOGIN – A default user process is created named IUSR_computername at the time of IIS installation. In the Internet Authentication section of the WWW service properties page, choose Allow Anonymous. Browsers can be accessed for anonymous users for which the IUSR_computername account has permissions. No Access rights are assigned with IIS's permissions for the IUSR_computername account to the restricted directory or file.

BASIC AUTHENTICATION (CLEAR TEXT) – Used across the wire to clear text with any credentials provided. It offers weak security and should only be used when necessary. A necessary example is a Web-based Web browser. Basic authentication can be applied to all users or a subset of users.

WINDOWS NT CHALLENGE-RESPONSE AUTHENTICATION – Does not require user passwords across the network. It performs calculations on the server and the client. There is no prompt for a name or password because the client software was established login information. It is more secure than Basic but only works if the client browser is Microsoft Internet Explorer; the client and server can be in the same or a trusted domain and it must be on a Windows platform.

LOAD BALANCING

LOAD BALANCING – Process of distributing the workload equally among multiple servers. There are three methods:

Distribute Name System (DNS) – Individual IP addresses for each proxy server are mapped to the same domain name. More through a list of IP addresses mapped to the domain name as the DNS server returns lookup requests. Not fault tolerant.

Array – Each proxy server maintains a list of servers that are currently up or down. Provides load balancing and fault tolerance. Automatically recalculates redistribution of all array members. You will need to store a domain name in DNS. Map the domain name to the IP addresses of proxy servers in the array. The loss of an individual proxy server will cause the array to reconfigure.

Cache Array Mirroring Protocol (CAMP) – Used in arrays to achieve load balancing and fault tolerance with caching. Achieved using multiple proxy servers arranged as a single logical cache. Calculations based on the proxy server member locations and the Uniform Resource Locator (URL) determine the request resolution path. A process called *spaceless distributed caching* will ensure the cache object is returned by the proxy server's browser that has the object in cache or the array members will forward proxy server requests by the correct browser network traffic and lower disk space needed for caching.

MINIMUM HARDWARE REQUIREMENTS

- **Intel 486/386 or better, or Alpha 3000**
- **At least 10MB of disk space for installation of Proxy Server. There must be 10MB + 0.2MB per user for caching. There must also be an NTFS partition of at least 1MB.**
- **At least 20MB of RAM; 32MB for 32-bit-based systems.**

You may want to disable as much as possible for optimum configuration, especially RAM.

CONFIGURATION TOOLS

Although Internet Service Manager is your primary tool for configuring and administering Proxy Server, there are several other tools that you can use:

REQUEST REQUESTER – Available by default on Windows NT Server. They can be used to request or request registry files. They can also be used to request, edit, add, delete, rename, and create new files and folders.

PROXYMAN – A command-line utility used to perform administrative and configuration tasks. Can be used in batch scripts used to control multiple servers. It is a command-line utility. It is the default tool for Proxy Server. It is installed and runs meaningfully in a display command mode.

WINDPROXY – Used to add, delete, or edit Windows Proxy server protocol definitions. At a command prompt, which is the proxy server directory. Type `WinProxy` for syntax.

NET START – Command used to start and stop WWW services, Web Proxy service, and Socks Proxy service.

SERVICES CONTROL PANEL – Used to enable or disable services. Controls whether a service starts manually or automatically.
