, 1967 Comprehensive Nuclear Materials , 2020-07-22 Materials in a nuclear environment are exposed to extreme
conditions of radiation temperature and or corrosion and in many cases the combination of these makes the material
behavior very different from conventional materials This is evident for the four major technological challenges the nuclear
technology domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the
next generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the
intermediate and final disposal of nuclear waste In order to address these challenges engineers and designers need to know
the properties of a wide variety of materials under these conditions and to understand the underlying processes affecting
changes in their behavior in order to assess their performance and to determine the limits of operation Comprehensive
Nuclear Materials Second Edition Seven Volume Set provides broad ranging validated summaries of all the major topics in
the field of nuclear material research for fission as well as fusion reactor systems Attention is given to the fundamental
scientific aspects of nuclear materials fuel and structural materials for fission reactors waste materials and materials for
fusion reactors The articles are written at a level that allows undergraduate students to understand the material while
providing active researchers with a ready reference resource of information Most of the chapters from the first Edition have
been revised and updated and a significant number of new topics are covered in completely new material During the ten
years between the two editions the challenge for applications of nuclear materials has been significantly impacted by world
events public awareness and technological innovation Materials play a key role as enablers of new technologies and we trust
that this new edition of Comprehensive Nuclear Materials has captured the key recent developments Critically reviews the
major classes and functions of materials supporting the selection assessment validation and engineering of materials in
extreme nuclear environments Comprehensive resource for up to date and authoritative information which is not always
available elsewhere even in journals Provides an in depth treatment of materials modeling and simulation with a specific
focus on nuclear issues Serves as an excellent entry point for students and researchers new to the field **Fusion Energy**
