My Numbers, My Friends Paulo Ribenboim, 2006-05-10 This selection of expository essays by Paulo Ribenboim should be of interest to mathematicians from all walks Ribenboim a highly praised author of several popular titles writes each essay in a light and humorous language without secrets making them thoroughly accessible to everyone with an interest in numbers This new collection includes essays on Fibonacci numbers prime numbers Bernoulli numbers and historical presentations of the main problems pertaining to elementary number theory such as Kummer's work on Fermat's last theorem

Combinatorics and Number Theory of Counting Sequences Istvan Mezo, 2019-08-19 *Combinatorics and Number Theory of Counting Sequences* is an introduction to the theory of finite set partitions and to the enumeration of cycle decompositions of permutations The presentation prioritizes elementary enumerative proofs Therefore parts of the book are designed so that even those high school students and teachers who are interested in combinatorics can have the benefit of them Still the book collects vast up to date information for many counting sequences especially related to set partitions and permutations so it is a must have piece for those mathematicians who do research on enumerative combinatorics In addition the book contains number theoretical results on counting sequences of set partitions and permutations so number theorists who would like to see nice applications of their area of interest in combinatorics will enjoy the book too Features The Outlook sections at the end of each chapter guide the reader towards topics not covered in the book and many of the Outlook items point towards new research problems An extensive bibliography and tables at the end make the book usable as a standard reference Citations to results which were scattered in the literature now become easy because huge parts of the book especially in parts II and III appear in book form for the first time

Abstract Algebra and Famous Impossibilities Sidney A. Morris, Arthur Jones, Kenneth R. Pearson, 2022-11-26 This textbook develops the abstract algebra necessary to prove the impossibility of four famous mathematical feats squaring the circle trisecting the angle doubling the cube and solving quintic equations All the relevant concepts about fields are introduced concretely with the geometrical questions providing motivation for the algebraic concepts By focusing on problems that are as easy to approach as they were fiendishly difficult to resolve the authors provide a uniquely accessible introduction to the power of abstraction Beginning with a brief account of the history of these fabled problems the book goes on to present the theory of fields polynomials field extensions and irreducible polynomials Straightedge and compass constructions establish the standards for constructability and offer a glimpse into why squaring doubling and trisecting appeared so tractable to professional and amateur mathematicians alike However the connection between geometry and algebra allows the reader to bypass two millennia of failed geometric attempts arriving at the elegant algebraic conclusion that such constructions are impossible From here focus turns to a challenging problem within algebra itself finding a general formula for solving a quintic polynomial The proof of the impossibility of this task is presented using Abel's original approach Abstract Algebra and Famous Impossibilities illustrates the enormous power of algebraic abstraction by exploring several notable historical triumphs This new edition adds the fourth impossibility solving general quintic equations Students and instructors alike will appreciate the illuminating examples conversational commentary and engaging exercises that accompany each section A first course in linear algebra is assumed along with a basic familiarity with integral calculus

Approximation and Computation in Science and Engineering Nicholas J. Daras, Themistocles M. Rassias, 2022-05-05 In recent years extensive research has been conducted by eminent mathematicians and engineers whose results and proposed problems are presented in this new volume It is addressed to graduate students research mathematicians physicists and engineers Individual contributions are devoted to topics of approximation theory functional equations and inequalities fixed point theory numerical analysis theory of wavelets convex analysis topology operator theory differential operators fractional integral operators integro differential equations ternary algebras super and hyper relators variational analysis discrete mathematics cryptography and a variety of applications in interdisciplinary topics Several of these domains have a strong connection with both theories and problems of linear and nonlinear optimization The combination of results from various domains provides the reader with a solid state of the art interdisciplinary reference to theory and problems Some of the works provide guidelines for further research and proposals for new directions and open problems with relevant discussions

Mathematical Constants II Steven R. Finch, 2003 Famous mathematical constants include the ratio of circular circumference to diameter $\frac{3}{14}$ and the natural logarithm base $e^{2.718}$ Students and professionals can often name a few others but there are many more buried in the literature and awaiting discovery How do such constants arise and why are they important Here the author renews the search he began in his book Mathematical Constants adding another 133 essays that broaden the landscape Topics include the minimality of soap film surfaces prime numbers elliptic curves and modular forms Poisson Voronoi tessellations random triangles Brownian motion uncertainty inequalities Prandtl Blasius flow from fluid dynamics Lyapunov exponents knots and tangles continued fractions Galton Watson trees electrical capacitance from potential theory Zermelo's navigation problem and the optimal control of a pendulum Unsolved problems appear virtually everywhere as well This volume continues an outstanding scholarly attempt to bring together all significant mathematical constants in one place
