Research Agenda for Test Methods and Models to Simulate the Accelerated Aging of Infrastructure Materials

National Research Council, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, Board on Infrastructure and the Constructed Environment, 1999-07-29 In the next several decades a significant percentage of the country's transportation communications environmental and power system infrastructures as well as public buildings and facilities will have to be renewed or replaced Next generation infrastructure will have to meet very high expectations in terms of durability constructability performance and life cycle cost One way of meeting future expectations will be through improved high performance materials but before new materials can be confidently deployed in the field a thorough and comprehensive understanding must be developed of their long term performance in a variety of applications and physical environments The National Science Foundation NSF has launched an initiative to promote the development of innovative short term laboratory or in situ tests for making accurate reliable predictions of the long term performance of materials and requested that the National Research Council NRC conduct a workshop as a reconnaissance level assessment of models and methods that are being used or potentially could be used to determine the long term performance of infrastructure materials and components *Methods and Models in Transport and Telecommunications* Aura

Reggiani, Laurie A. Schintler, 2006-03-30 One aspect of the new economy is a transition to a networked society and the emergence of a highly interconnected interdependent and complex system of networks to move people goods and information An example of this is the increasing reliance of networked systems e.g. air transportation networks electric power grid maritime transport etc on telecommunications and information infrastructure Many of the networks that evolved today have an added complexity in that they have both a spatial structure i.e. they are located in physical space but also an a spatial dimension brought on largely by their dependence on information technology They are also often just one component of a larger system of geographically integrated and overlapping networks operating at different spatial levels An understanding of these complexities is imperative for the design of plans and policies that can be used to optimize the efficiency performance and safety of transportation telecommunications and other networked systems In one sense technological advances along with economic forces that encourage the clustering of activities in space to reduce transaction costs have led to more efficient network structures At the same time the very properties that make these networks more efficient have also put them at a greater risk for becoming disconnected or significantly disrupted when super connected nodes are removed either intentionally or through a targeted attack **Building Technology Project Summaries, 1979** Center for Building

Each segment consisted of several presentations followed by comments from noted psychometricians and a break out session in which presenters and discussants identified important issues and established priorities for a CBT research agenda This volume contains the papers presented at the colloquium the discussant remarks based on those papers and the research agenda that was generated from the break out sessions Computer Based Testing Building the Foundation for Future Assessments is must reading for professionals scholars and advanced students working in the testing field as well as people in the information technology field who have an interest in testing **Ventilation Strategies and Measurement**
