complementary aspects in common that make a combination of these systems into a coherent system vision promising In particular the important notions of control heterogeneity wireless communication dynamic and ad hoc nature and cost are prevalent to various degrees in each of these systems A future system concept needs to combine the strong points of all three system concepts in at least these functional aspects It has to provide support for the control of physical processes like today s embedded systems do have as good support for device heterogeneity and spontaneity of usage as required by pervasive and ubiquitous computing approaches and has to be as cost efficient and wirelessly agile as wireless sensor networks are These new systems consist therefore of individual entities or objects that jointly strive to reach a common goal which will typically be a goal in sensing or control and are dynamically and loosely federating themselves for cooperation taking care not to overtax their available resources This book presents a roadmap to these concepts which are summarized as cooperating objects
