Remote Sensing In Hydrology And Water Management:

Remote Sensing in Hydrology and Water Management Gert A. Schultz, Edwin T. Engman, 2012-12-06 The authors of this book have been approached by consulting engineers You know about remote sensing and thus you can obtain hydrological information where no data exist even without ground measurements so that I can design the required capacity of a drinking water supply reservoir in a developing country On the other hand the authors have been told Remote sensing is not of much use since it is still impossible to estimate ground water resources or surface water flows from remote sensing data The major aim of this book is to correct such unjustified illusions as well as exaggerated criticism by providing the reader with sound information on the potential and the limitations of remote sensing in the field of hydrology and water management The book is meant to be a reference and text it is not a collection of papers from some meeting The book is intended to provide methods to help the readers solve their own problems in hydrology and water management Therefore scientific issues are presented only as far as they are necessary for the application of remote sensing The reader will see that in some fields e g evapotranspiration soil moisture hydrological modeling the scientific development is still on the way while in others operational techniques are already available e g snow melt run off model land use classification and detection of land use changes flood forecasting and control

Remote Sensing in Hydrology and Water Resources Management Weili Duan, Shreedhar Maskey, Pedro Luiz Borges Chaffe, 2021-12-23 Water resources are the most valuable resources of sustainable socio economic development which is significantly affected by climate change and human activities Water resources assessment is an urgent need for implementation of the perfect water resources management but it is difficult to accurately evaluate the quantity and quality of water resources especially in arid regions and high altitude regions with sparse gauged data This book hosts 24 papers devoted to remote sensing in hydrology and water resources management which summarizes the recent advancement in remote sensing technology for hydrology analysis such as satellite remote sensing for water resources management water quality monitoring and evaluation using remote sensing data remote sensing for detecting the global impact of climate extremes the use of remote sensing data for improved calibration of hydrological models and so on In general the book will contribute to promote the application of remote sensing technology in water resources

Chen, 2016-05-04 This book is a collection of overview articles showing how space based observations combined with hydrological modeling have considerably improved our knowledge of the continental water cycle and its sensitivity to climate change Two main issues are highlighted 1 the use in combination of space observations for monitoring water storage changes in river basins worldwide and 2 the use of space data in hydrological

modeling either through data assimilation or as external constraints The water resources aspect is also addressed as well as the impacts of direct anthropogenic forcing on land hydrology e g ground water depletion dam building on rivers crop irrigation changes in land use and agricultural practices etc Remote sensing observations offer important new information on this important topic as well which is highly useful for achieving water management objectives Over the past 15 years remote sensing techniques have increasingly demonstrated their capability to monitor components of the water balance of large river basins on time scales ranging from months to decades satellite altimetry routinely monitors water level changes in large rivers lakes and floodplains When combined with satellite imagery this technique can also measure surface water volume variations Passive and active microwave sensors offer important information on soil moisture e g the SMOS mission as well as wetlands and snowpack The GRACE space gravity mission offers for the first time the possibility of directly measuring spatio temporal variations in the total vertically integrated terrestrial water storage When combined with other space observations e g from satellite altimetry and SMOS or model estimates of surface waters and soil moisture space gravity data can effectively measure groundwater storage variations New satellite missions planned for the coming years will complement the constellation of satellites monitoring waters on land This is particularly the case for the SWOT mission which is expected to revolutionize land surface hydrology Previously published in *Surveys in Geophysics* Volume 37 No 2 2016 *Earth Observation for Water Resources Management* Luis García, Diego Rodríguez, Marcus Wijnen, Inge Pakulski, 2016-04-14 Water systems are building blocks for poverty alleviation shared growth sustainable development and green growth strategies They require data from in situ observation networks Budgetary and other constraints have taken a toll on their operation and there are many regions in the world where the data are scarce or unreliable Increasingly remote sensing satellite based earth observation is becoming an alternative This book briefly describes some key global water challenges perspectives for remote sensing approaches and their importance for water resources related activities It describes eight key types of water resources management variables a list of sensors that can produce such information and a description of existing data products with examples *Earth Observation for Water Resources Management* provides a series of practical guidelines that can be used by project leaders to decide whether remote sensing may be useful for the problem at hand and suitable data sources to consider if so The book concludes with a review of the literature on reliability statistics of remote sensed estimations *Remote Sensing in Hydrology* E.
