Abstract:

In 1997, the National Institute of Standards and Technology (NIST) initiated a process to select a symmetric-key encryption algorithm to be used to protect sensitive (unclassified) Federal information in furtherance of NIST's statutory responsibilities. In 1998, NIST announced the acceptance of fifteen candidate algorithms and requested the assistance of the cryptographic research community in analyzing the candidates. This analysis included an initial examination of the security and efficiency characteristics for each algorithm. NIST reviewed the results of this preliminary research and selected MARS, RC6™, Rijndael, Serpent and Twofish as finalists. Having reviewed further public analysis of the finalists, NIST has decided to propose **Rijndael** as the Advanced Encryption Standard (AES). The research results and rationale for this selection are documented in this report.

Key words: Advanced Encryption Standard (AES), cryptography, cryptanalysis, cryptographic algorithms, encryption, Rijndael.

System-on-Chip Architectures and Implementations for Private-Key Data Encryption Máire McLoone, John V. McCanny, 2012-12-06 In System on Chip Architectures and Implementations for Private Key Data Encryption new generic silicon architectures for the DES and Rijndael symmetric key encryption algorithms are presented The generic architectures can be utilised to rapidly and effortlessly generate system on chip cores which support numerous application requirements most importantly different modes of operation and encryption and decryption capabilities In addition efficient silicon SHA 1 SHA 2 and HMAC hash algorithm architectures are described A single chip Internet Protocol Security IPSec architecture is also presented that comprises a generic Rijndael design and a highly efficient HMAC SHA 1 implementation In the opinion of the authors highly efficient hardware implementations of cryptographic algorithms are provided in this book However these are not hard fast solutions The aim of the book is to provide an excellent guide to the design and development process involved in the translation from encryption algorithm to silicon chip implementation

Symmetric Cryptography, Volume 1 Christina Boura, Maria Naya-Plasencia, 2024-01-04 Symmetric cryptology is one of the two main branches of cryptology Its applications are essential and vital in the Information Age due to the efficiency of its constructions The scope of this book in two volumes is two fold First it presents the most important ideas that have been used in the design of symmetric primitives their inner components and their most relevant constructions Second it describes and provides insights on the most popular cryptanalysis and proof techniques for analyzing the security of the above

algorithms A selected number of future directions such as post quantum security or design of ciphers for modern needs and particular applications are also discussed We believe that the two volumes of this work will be of interest to researchers to master s and PhD students studying or working in the field of cryptography as well as to all professionals working in the field of cybersecurity
