## Semiconductor Plasma Instabilities:

*Semiconductor Plasma Instabilities, Including Gunn-effect and Avalanche Oscillations* Hans Hartnagel, 1969      *Plasma and Current Instabilities in Semiconductors* Juras Pozhela, 2017-05-03

Plasma and Current Instabilities in Semiconductors details the main ideas in the physics of plasma and current instabilities in semiconductors. The title first covers plasma in semiconductors and then proceeds to tackling waves in plasma. Next the selection details wave instabilities in plasma and drift instabilities. The text also discusses hot electrons along with the instabilities due to inter valley electron transfer. The next chapters talk about avalanche and recombination instabilities. The last chapter deals with plasma streams. The book will be of great use to student and professional electronics engineers and technicians.

*Semiconductor Plasma Instabilities* Hans Hartnagel, 1969      **Handbook on Plasma Instabilities** Ferdinand F. Cap, 2013-09-11

Handbook on Plasma Instabilities Volume 3 is primarily intended to serve as a sourcebook for obtaining quick information and literature references pertaining to a specific topic. Such a handbook has to be formulated in a way that enables understanding of any one section without requiring full understanding of any other section. Volume 1 Chapters 1-13 presents the fundamental concepts of plasma physics with applications and has more the nature of a textbook treating basic plasma physics: confinement, waves and macroscopic instabilities. Volume 2 Chapters 14-17 covers various aspects of microinstabilities: beam-plasma systems, stabilization methods and parametric effects. The present volume Chapters 18-22 starts with a discussion on feedback and dynamic stabilization using parametric and other effects. It then treats nonlinear effects and laser-plasma systems. One chapter is devoted to applications and use of instabilities. It concludes with a report on plasma waves and instabilities in cosmic space.

Negative Differential Resistance and Instabilities in 2-D Semiconductors N. Balkan, B.K. Ridley, A.J. Vickers, 2012-12-06

Instabilities associated with hot electrons in semiconductors have been investigated from the beginning of transistor physics in the 1940s. The study of NDR and impact ionization in bulk material led to devices like the Gunn diode and the avalanche photo diode. In layered semiconductors, domain formation in HEMTs can lead to excess gate leakage and to excess noise. The studies of hot electron transport parallel to the layers in heterostructures, single and multiple, have shown abundant evidence of electrical instability and there has been no shortage of suggestions concerning novel NDR mechanisms such as real space transfer, scattering induced NDR, inter-sub band transfer, percolation effects etc. Real space transfer has been exploited in negative resistance PETs, NERFETs and in the charge injection transistor CHINT and in light emitting logic devices but far too little is known and understood about other NDR mechanisms with which quantum well material appears to be particularly well endowed for these to be similarly exploited. The aim of this book is therefore to collate what is known and what is not known about NDR instabilities and to identify promising approaches and techniques which will increase our understanding of the origin of these instabilities which have been observed during the last decade of investigations into high field longitudinal transport in layered semiconductors. The book covers the fundamental properties of

hot carrier transport and the associated instabilities and light emission in 2 dimensional semiconductors dealing with both theory and experiment      **Instability of a Drifting Semiconductor Plasma in a Transverse Magnetic Field** Stanford University. Glass,Arthur Henry Guenther,1974      **Quantum Kinetic Theory** Michael Bonitz,2015-11-20 This book presents quantum kinetic theory in a comprehensive way The focus is on density operator methods and on non equilibrium Green functions The theory allows to rigorously treat nonequilibrium dynamics in quantum many body systems Of particular interest are ultrafast processes in plasmas condensed matter and trapped atoms that are stimulated by rapidly developing experiments with short pulse lasers and free electron lasers To describe these experiments theoretically the most powerful approach is given by non Markovian quantum kinetic equations that are discussed in detail including computational aspects      **Plasma Instabilities and Anomalous Transport** William B.
