Senescence In Plants:

Senescence and Aging in Plants L.D. Nooden, 2012-12-02 *Senescence and Aging in Plants* reviews the state of knowledge in the processes involved in plant senescence and aging. The book begins by discussing the emergence of senescence as a concept, experimental analysis of senescence and patterns of senescence. It then examines membrane deterioration during senescence, photosynthesis in relation to leaf senescence, senescence of detached plant organs, changing patterns of nucleic acid and protein synthesis during senescence, and degradative and associated assimilatory aspects of nitrogen removal. This is followed by chapters on aspects of ethylene that may impinge upon its role in promoting senescence of higher plants, the role of cytokinins in plant senescence, the promoters and retardants of senescence, and the role of calcium in plant senescence. The concept of whole plant senescence is discussed, which can be subdivided into patterns, correlative controls, cessation of vegetative growth, declining assimilatory processes, assimilate partitioning, and hormonal controls. The final chapters cover the deterioration of cellular membranes during the plant aging process and seed aging. Annual Plant Reviews, Senescence Processes in Plants Susheng Gan, 2008-04-15 The scientific and economic significance of plant senescence means that much effort has been made to understand the processes involved and to devise means of manipulating them agriculturally. During the past few years there has been considerable progress in this regard, especially in the molecular, genetic, and genomic aspects. Senescence has a tremendous impact on agriculture. For example, leaf senescence limits crop yield and biomass production and contributes substantially to postharvest loss in vegetable and ornamental crops during transportation, storage, and on shelves. In addition, proteins, antioxidants, and other nutritional compounds are degraded during senescence. Senescing tissues also become more susceptible to pathogen infection, and some of the pathogens may produce toxins rendering food unsafe. Mitotic senescence may also determine sizes of leaves, fruits, and whole plants. This volume summarizes recent progresses in the physiology, biochemistry, cell biology, molecular biology, genomics, proteomics, and biotechnology of plant senescence. Beginning with a chapter on senescence-related terminology and our current knowledge of mitotic senescence in plants, a less well-studied area, the book focuses on post-mitotic senescence and includes chapters addressing the senescence of leaves, flowers, and fruits. Later chapters examine the development of various new biotechnologies for manipulating the senescence processes of fruit and leaves, some of which are approaching commercialization. The book is directed at researchers and professionals in plant molecular genetics, physiology, and biochemistry. Senescence Signalling and Control in Plants Maryam Sarwat, Narendra Tuteja, 2018-11-29 *Senescence Signalling and Control in Plants* discusses the studies showing the importance of hormone action on developmental senescence. It shows the involvement of various signaling components such as EIN2, LOX2, and transcription factors such as *ORE1* or *ORE1* in controlling hormonal activity during senescence. Further, the involvement of various microRNAs, *miR164*, *miR319* in regulating leaf senescence are discussed. Through this book, the authors throw light on all the reverse and forward

genetic approaches to reveal the role of various other phytohormones regulating plant senescence and the molecular mechanisms involved Chapters on relevant topics are contributed by experts working in the area making this a comprehensive treatise designed to provide an in depth analysis on the subject matter Throws light on the involvement of hormones other than the well known hormones cytokine and ethylene in plant senescence Shows the underlying mechanisms on the hormonal actions during senescence Exhibits the involvement of microRNAs during this important plant developmental process

Annual Plant Reviews, Senescence Processes in Plants Susheng Gan, 2007-04-23 The scientific and economic significance of plant senescence means that much effort has been made to understand the processes involved and to devise means of manipulating them agriculturally During the past few years there has been considerable progress in this regard especially in the molecular genetic and genomic aspects Senescence has a tremendous impact on agriculture For example leaf senescence limits crop yield and biomass production and contributes substantially to postharvest loss in vegetable and ornamental crops during transportation storage and on shelves In addition proteins antioxidants and other nutritional compounds are degraded during senescence Senescing tissues also become more susceptible to pathogen infection and some of the pathogens may produce toxins rendering food unsafe Mitotic senescence may also determine sizes of leaves fruits and whole plants This volume summarizes recent progresses in the physiology biochemistry cell biology molecular biology genomics proteomics and biotechnology of plant senescence Beginning with a chapter on senescence related terminology and our current knowledge of mitotic senescence in plants a less well studied area the book focuses on post mitotic senescence and includes chapters addressing the senescence of leaves flowers and fruits Later chapters examine the development of various new biotechnologies for manipulating the senescence processes of fruit and leaves some of which are approaching commercialization The book is directed at researchers and professionals in plant molecular genetics physiology and biochemistry

Life History Evolution in Plants Timo Olavi Vuorisalo, P. Mutikainen, 2001-11-30 The lack of discussion of the life histories of modular organisms is the weakness of this book that I most regret Modular organisms are different S C Steams The Evolution of Life Histories 1992 Life history theory endeavours to increase our understanding of the processes whereby the broad features of the life cycles of organisms such as the timing and magnitude of reproduction have evolved Although reproductive traits have dominated as study objects due to their immediate importance for evolutionary success much work has also been conducted on patterns of development growth and senescence as well as on the shifts in resource allocation related to these processes The basic axiom of life history theory is that patterns of life histories such as reproductive traits are subject to evolutionary explanation This idea can be traced back at least as far as Darwin's Origin of Species 1859 In his discussion of plant domestication Darwin wrote I cannot doubt that the continued selection of slight variations either in the leaves the flowers or the fruit will produce races differing from each other chiefly in these characters Darwin was impressed by the success of plant breeders in moulding the growth and reproductive parameters of cultivated plants and believed that natural selection could have a similar impact in natural populations

Stress Signaling in Plants: Genomics and Proteomics Perspective, Volume 2 Maryam Sarwat, Altaf Ahmad, M. Z. Abdin, Mohamed M. Ibrahim, 2016-12-28 This two volume set takes an in depth look at stress signaling in plants from a uniquely genomic and proteomic perspective and offers a comprehensive treatise that covers all of the signaling pathways and mechanisms that have been researched so far Currently plant diseases extreme weather caused by climate change drought and an increase in metals in soil are amongst the major limiting factors of crop production worldwide They devastate not only the food supply but also the economy of a nation With global food scarcity in mind there is an urgent need to develop crop plants with increased stress tolerance so as to meet the global food demands and to preserve the quality of our planet In order to do this it is necessary to understand how plants react and adapt to stress from the genomic and proteomic perspective Plants adapt to stress conditions by activating cascades of molecular mechanisms which result in alterations in gene expression and synthesis of protective proteins From the perception of the stimulus to the transduction of the signal followed by an appropriate cellular response the plants employ a complex network of primary and secondary messenger molecules Cells exercise a large number of noticeably distinct signaling pathways to regulate their activity In order to contend with different environmental adversities plants have developed a series of mechanisms at the physiological cellular and molecular levels that respond to stress Each chapter in this volume provides an in depth explanation of what we currently know of a particular aspect of stress signaling and where we are heading Together with the highly successful first volume *Stress Signaling in Plants Genomics and Proteomics Perspective Volume 1* Volume 2 covers an important aspect of plant

biology for both students and seasoned researchers *Abiotic Stress Signaling in Plants: Functional Genomic Intervention, Volume II* Girdhar Kumar Pandey, Ashish Kumar Srivastava, Amita Pandey, Maik Böhmer, 2024-01-31 This Research Topic is part of the Abiotic Stress Signaling in Plants Functional Genomic Intervention series Abiotic Stress Signaling in Plants Functional Genomic Intervention Abiotic stresses such as high temperature low temperature drought and salinity limit crop productivity worldwide Understanding plant responses to these stresses is essential for rational engineering of crop plants In Arabidopsis the signal transduction pathways for abiotic stresses light several phytohormones and pathogenesis have been elucidated A significant portion of plant genomes most studies are Arabidopsis and rice genome encodes for proteins involved in signaling such as receptor sensors kinases phosphatases transcription factors and transporters channels Despite decades of physiological and molecular effort knowledge pertaining to how plants sense and transduce low and high temperature low water availability drought water submergence and salinity signals is still a major question before plant biologist One major constraint hampering our understanding of these signal transduction processes in plants has been the lack or slow pace of application of molecular genomic and genetics knowledge in the form of gene function *Ethylene: A Key Regulatory Molecule in Plants* Nafees A. Khan, M. Iqbal R. Khan, Antonio Ferrante, Péter Poór, 2017-12-21 Ethylene is a simple gaseous phytohormone with multiple roles in regulation of metabolism at cellular molecular and whole plant level It influences performance of plants under optimal and stressful environments by interacting with other signaling molecules Understanding the ethylene biosynthesis and action through the plant's life can contribute to improve the knowledge of plant functionality and use of this plant hormone may drive adaptation and defense of plants from the adverse environmental conditions The action of ethylene depends on its concentration in cell and the sensitivity of plants to the hormone In recent years research on ethylene has been focused due to its dual action on the regulation of plant processes at physiological and molecular level The involvement of ethylene in the regulation of transcription needs to be widely explored involving the interaction with other key molecular regulators The aim of the current research topic was to explore and update our understanding on its regulatory role in plant developmental mechanisms at cellular or whole plant level under optimal and changing environmental conditions The present edited volume includes original research papers and review articles describing ethylene's regulatory role in plant development during plant ontogeny and also explains how it interacts with biotic and abiotic stress factors This comprehensive collection of researches provide evidence that ethylene is essential in different physiological processes and does not always work alone but in coordinated manner with other plant hormones This research topic is also a source of tips for further works that should be addressed for the biology and molecular effects on plants
