

The neurotransmitter serotonin is involved in regulating many important physiological (body-oriented) functions, including sleep, aggression, eating, sexual behavior, and mood.

Serotonin is produced by serotonergic neurons. Current research suggests that a decrease in the production of serotonin by these neurons can cause depression in some people, and more specifically, a mood state that can cause some people to feel suicidal.

Drugs, however, have many negative side effects. Other options need to be considered. People who are depressed need a safe way to restore the neurochemistry (NC) of their central nervous system.

Serotonin Bernard Haber, 2012-12-06 The vast growth of knowledge in recent years concerning the functional role of serotonergic systems in central nervous system function prompted the organization of the symposium The organizing committees felt at the onset that the field of serotonin research had grown so rapidly that it would be impossible to cover every aspect of it in individual symposia Thus it was felt that certain areas of research had to be omitted due to time constraints and we extend an apology to the researchers in areas not included in these proceedings Rather it was hoped to provide a balance overview of the field starting with the anatomy of serotonergic systems and proceeding to the level of the serotonergic receptors at the cell membrane and then inside the neuron to discuss the regulation of serotonin biosynthesis and integration within indoleamine systems The functional aspects of serotonergic transmission focused on the emerging role of this amine in the processing of nociceptive information singly or in tandem with other neurotransmitters or neuromodulators A separate symposium dealt with a variety of animal models suitable for the analysis of the role of serotonin in behavior and finally led to the evaluation of serotonin metabolism in the study of abnormal human behavior The editors would like to dedicate these proceedings on Serotonin Current Aspects of Neurochemistry and Function to two pioneers in this field Dr Irving Page and Dr Maurice Rapport *Amino Acid Availability and Brain Function in Health and Disease*

Gerald Huether, 2013-06-29 The picture on the following page is being reproduced here at the request of the participants in the Advanced Research Workshop Amino Acid Availability and Brain Function in Health and Disease I displayed this limewood carving entitled Neurochemistry during my closing remarks to this extraordinarily stimulating and productive workshop so ably organized by my collaborator Dr Gerald Huether We scientists need two sturdy legs to carry us through all the twists and turns of our academic careers We should also have as it were a reserve leg handy to help us stay upright when this career ends My third leg is wood carving The idea for Neurochemistry came to me in the plane carrying me to the congress of the International Neurochemical Society in Jerusalem We need the hands for our meticulous experimental work and at least one ear to listen to the messages our neurons send us A few years ago it would have been premature to hold a workshop on this subject Now however the time was just right to allow an overview of the status of current research and to point out the promising new openings it has created There is no doubt that the book to be published as a result of this workshop will be for the next years at least the standard text on the subject Heartily thanks to all speakers for their brilliant contributions and to all participants for the lively uninhibited and stimulating discussion *Serotonergic Neurons and 5-HT Receptors in the CNS* H.G. **Neurotransmitter Actions in the Vertebrate Nervous System** Michael Rogawski,2012-12-06 Inter-cellular communication via bioactive substances occurs in virtually all multicellular systems Chemical neurotransmission in the vertebrate nervous system represents a form of signaling of this type The biology of chemical neurotransmission is complex involving transmitter synthesis transport and release by the presynaptic neuron signal generation in the target tissue and mechanisms for termination of the response The focus of this book is on one aspect of this scheme the diverse electrophysiological effects induced by different neurotransmitters on target cells In recent years astonishing progress has been made in elucidating the specific physiological signals mediated by neurotransmitters in the vertebrate nervous system yet in our view this has not been adequately recognized perhaps because the new concepts have yet to filter into neuroscience textbooks Nevertheless the principles of neurotransmitter action are critical to advances in many areas of neuroscience including molecular neurobiology neurochemistry neuropharmacology physiological psychology and clinical neuroscience It was the need for a sourcebook that prompted us to engage a group of neurophysiologists to prepare the chapters in this volume However there was an additional reason for this book more and more it seemed that the field if not yet having reached maturity at least was approaching adolescence with strengths in some areas and healthy conflicts in others At this stage of development a textbook can help to define a field clarify problems to be resolved and identify areas for future investigation      *Neurochemical Techniques in Insect Research* H. Breer,T.A. Miller,2012-12-06 Neurochemical Techniques in Insect Research properly emphasizes the insect It only scratches the surface of the exploding repertoire of general neurochemical techniques that can be applied to insect research in 1985 But it also presents the advantages of using insects for studying certain biological questions that are approachable by neurochemical techniques Even more so it summarizes the long list of unique problems encountered in attempting to study insects by neurochemical techniques As in other volumes of this series the contributors to this volume are the authorities in the field They themselves have developed much of the material presented Thus the sum effort provides a true description of the state of the art and pleasantly it does so in a very complete and clear manner Readers of this series will not need to be reminded that despite the fact that vertebrates make up only about 3% of all animal species research in vertebrates such as insects has lagged behind that on invertebrates at least in the neurochemistry area the relative simplicity and large cell size of the insect nervous system has always provided incentive for work in neurophysiology and neuroanatomy Toxicology interests will always stimulate a certain amount of work on insect neuropharmacology and insects are extremely suitable for several areas of toxin research Last but not least the insects are beautiful organisms for which the applications of genetics can be made to the study of

treating certain pre and postmenopausal symptoms in women and androgens for treating some symptoms in aging men Up to about the 1960s the relatively few studies on endocrine aging relationships dealt mainly with changes in weight and histological appearance of endocrine organs in aging animals and human subjects and included a limited number of measurements of endocrine function by bioassays and chemical procedures Within these limitations gerontological investigators were unable to establish any definite relationships between endocrine functions and aging processes with the exception of the connection between reproductive decline and gonadal and pituitary activity

Lechin, 2002 The authors of this book developed the only clinical neurochemistry laboratory equipped routinely to assay all circulating neurotransmitters These parameters have been measured in more than 20 000 normal severely diseased depressed stressed and psychosomatic patients The results obtained have been published in more than 100 scientific papers The authors postulated the existence of at least three well defined types of pathophysiologic profiles 1 endogenous depression 2 dysthymic depression and 3 uncoping maladapted to stress Being aware of them clinicians can prescribe distinct neuropharmacological therapies The first and third profiles are also registered in Th1 and Th2 autoimmune diseased patients respectively The first part of the book is devoted to the outline of these central neurocircuitry functions during the wake sleep cycle in normal subjects as well as depressive states uncoping stress psychotics bipolar disorders and panic attacks Due to these neuroautonomic and neuroimmune interactions being noticed various neuropharmacological

therapeutic approaches can be referred to In a second part the authors present treatments able to cure or help improve diseases presenting with a Th1 autoimmune profile as well as a Th2 autoimmune profile
