Post-Transcriptional Processing and the Endocrine System S. L. Chew, Federica Guaraldi, 1999-07 Not much research has been done on the regulation of post transcriptional events much more is known about transcription This book illustrates how hormones may influence post transcriptional nuclear events and that some post transcriptional modification is a requirement for the expression and function of most higher eukaryotic genes Topics such as the regulation of pre mRNA splicing by hormonal signals and tissue specific mechanisms pre mRNA processing during spermatogenesis to the link between the cell cycle and splicing the role of phosphorylation and dephosphorylation in the function of the basal splicing machinery RNA editing the neuroendocrine regulation of polyadenylation all contribute to make up this volume If you are an endocrinologist searching for interesting and important answers unearthed by RNA experiments this book provides them

Molecular Biology Nancy Craig, Rachel Green, Orna Cohen-Fix, Carol Greider, Gisela Storz, Cynthia Wolberger, 2014-05 The biological world operates on a multitude of scales from molecules to tissues to organisms to ecosystems Throughout these myriad levels runs a common thread the communication and onward passage of information from cell to cell from organism to organism and ultimately from generation to generation But how does this information come alive to govern the processes that constitute life The answer lies in the molecular components that cooperate through a series of carefully regulated processes to bring the information in our genome to life These components and processes lie at the heart of one of the most fascinating subjects to engage the minds of scientists today molecular biology Molecular Biology Principles of Genome Function Second Edition offers a fresh approach to the teaching of molecular biology by focusing on the commonalities that exist between the three kingdoms of life and discussing the differences between the three kingdoms to offer instructive insights into molecular processes and components This gives students an accurate depiction of our current understanding of the conserved nature of molecular biology and the differences that underpin biological diversity Additionally an integrated approach demonstrates how certain molecular phenomena have diverse impacts on genome function by presenting them as themes that recur throughout the book rather than as artificially separated topics As an experimental science molecular

biology requires an appreciation for the approaches taken to yield the information from which concepts and principles are deduced Experimental Approach panels throughout the text describe research that has been particularly valuable in elucidating difference aspects of molecular biology Each panel is carefully cross referenced to the discussion of key molecular biology tools and techniques which are presented in a dedicated chapter at the end of the book Molecular Biology further enriches the learning experience with full color artwork end of chapter questions and summaries suggested further readings grouped by topic and an extensive glossary of key terms Features A focus on the underlying principles of molecular biology equips students with a robust conceptual framework on which to build their knowledge An emphasis on their commonalities reflects the processes and components that exist between bacteria archae and eukaryotes Experimental Approach panels demonstrate the importance of experimental evidence by describing research that has been particularly valuable in the field

implications for understanding human disease mechanisms, diagnostics, and cures Philipp Kapranov, The vast majority of the human genome has been historically ignored from the point of view of molecular mechanisms of disease diagnostics and potential therapeutic targets The predominant focus of disease research has traditionally been placed on the protein coding regions of the human genome which account for only 4 5% of its total sequence complexity This bias has an obvious underlying reason protein coding regions encode a crucial class of molecules in a cell whose function and importance are well established Furthermore proteins are the predominant class of cellular molecules against which effective therapeutics can be designed This bias pervades the design of analytical tools made to measure DNA DNA protein interactions as well as procedures used to measure and annotate transcriptome expression Microarrays for example are often biased to the regions of genome known to encode exons or promoters of protein coding mRNAs Other aspects of our approach towards measuring expression of RNAs such as the typical choice of polyA RNA selection enriched in mRNAs for next generation sequencing also reinforces this bias In summary the 2 3% of the genome and RNAs made from it has dominated the conceptual thinking of academic and medical communities as well as industries that make devices that measure nucleic acids for research or diagnostic purposes and the pharmaceutical industry However during the last decade a tide of data has gained sufficient momentum to suggest that the cell actually uses the remaining 97 98% of the genome to produce stable RNAs the so called dark matter RNA The first reports to suggest this were based on tiling array technology and sequencing of ESTs which while powerful had their limitations tiling arrays could not estimate the relative mass of the RNAs produced from the non protein coding regions in a cell and the EST sequencing methods were not deep enough The advent of next generation sequencing in particular single molecule sequencing has allowed us not only confirm the previous observations but also for the first time to estimate not only from where but also how much non exonic RNA is produced Its fraction of the total transcriptome is quite

significant up to 2/3 of all RNA made in a human cell <http://www.biomedcentral.com/1741-7007/8/149> Moreover the non exonic RNAs are differentially expressed in disease for example between the primary tumors and metastatic derivatives We believe that the logical next step from these observations is to ask three questions perhaps some of the most important questions of our time in biomedical science 1 Do dark matter RNAs underlie mechanisms of human disease 2 Can they be used for diagnostics and 3 Can they be used as targets for therapeutics We thus would like to propose a Research Topic in the Frontiers in Genetics Frontiers in Non Coding RNAs that is specifically dedicated to publishing manuscripts addressing these three questions

Molecular Biology Nancy Lynn Craig, Rachel Green, Carol C. Greider, Carol W. Greider, Gisela Storz, Cynthia Wolberger, Orna Cohen-Fix, 2021 Molecular Biology Principles of Genome Function offers a fresh distinctive approach to the teaching of molecular biology It is an approach that reflects the challenge of teaching a subject that is in many ways unrecognizable from the molecular biology of the 20th century a discipline in which our understanding has advanced immeasurably but about which many questions remain to be answered KEY FEATURES A focus on the underlying principles equips students with a robust conceptual framework on which to add further detail from the vast amount of scientific information available to us today An emphasis on commonalities reflects the conserved molecular processes and components that we now know to exist between bacteria archaea and eukaryotes Experimental Approach panels demonstrate the central importance of experimental evidence to furthering our understanding of molecular biology by describing research that has been particularly valuable in elucidating different aspects of the subject Online resources for both instructors and students alike enhance the educational value of the text NEW TO THIS EDITION New content on epigenetics targeted genome editing and pre mRNA splicing Cutting edge scientific breakthroughs in CRISPR technology including a description of newly defined steps in the molecular mechanisms underlying CRISPR mediated adaptation in bacterial adaptive immunity and a description of a recently discovered transposable element family whose integration mechanism is closely related to and involves molecular relatives of the CRISPR Cas bacterial adaptive immunity system Enhanced coverage of DNA replication and regulatory RNAs Seven new Experimental Approach panels This title is available as an eBook Visit VitalSource for more information or to purchase

Brookhaven Symposia in Biology Brookhaven National Laboratory,1948 Cytochrome Systems S. Papa,B.

Chance,L. Ernster,2012-12-06 This volume is based on the proceedings of an International Symposium on Cytochrome Systems Molecular Biology and Bioenergetics that was held at Selva di Fasano near Bari Italy between April 7 and 11 1987 It contains papers covering the subjects discussed at the Symposium contributed both by participants of the meeting and by some invited speakers who were not able to attend The aim of the Symposium was to bring together experts in various research strategies currently being applied to the study of cytochrome systems including molecular genetics protein chemistry enzymology of electron transfer and protonmotive activity in energy transducing biological membranes Because of the high degree of complexity of cytochrome systems and the increasing sophistication in recent years of the different experimental approaches there has been a growing specialization sometimes even a tendency to over specialization among scientists working in this field This in itself seemed to justify a meeting where representatives of various disciplines could exchange their results and discuss their conclusions In addition and perhaps even more importantly it was felt that meetings of this kind provide an opportunity for a cross fertilization of approaches and ideas among representatives of various fields of science The present meeting proved to be an ample illustration of the success of such an interaction
