Thrips
Biology and Management Bruce L. Parker, Margaret Skinner, Trevor Lewis, 2013-11-11 Thrips (Thysanoptera) are very small insects widespread throughout the world with a preponderance of tropical species many temperate ones and even a few living in arctic regions Of the approximately 5 000 species so far identified only a few hundred are crop pests causing serious damage or transmitting diseases to growing crops and harvestable produce in most countries Their fringed wings confer a natural ability to disperse widely blown by the wind Their minute size and cryptic behavior make them difficult to detect either in the field or in fresh vegetation transported during international trade of vegetables fruit and ornamental flowers Many species have now spread from their original natural habitats and hosts to favorable new environments where they often reproduce rapidly to develop intense damaging infestations that are costly to control Over the past decade there have been several spectacular examples of this The western flower thrips has expanded its range from the North American continent to Europe Australia and South Africa Thrips palmi has spread from its presumed origin the island of Sumatra to the coast of

Florida and threatens to extend its distribution throughout North and South America Pear thrips a known orchard pest of Europe and the western United States and Canada has recently become a major defoliator of hardwood trees in Vermont and the neighboring states Local outbreaks of other species are also becoming problems in field and glasshouse crops as the effectiveness of insecticides against them decline

Microbial Approaches for Insect Pest Management

Omkar,2022-01-01 This book brings together specialized information on modern aspects of applied microbiology in pest management In the last few decades the humans have witnessed major advancements in Life Sciences as a result several new and powerful tools and techniques have evolved This has led to great advancements in microbial nutrition genetics and their application in different fields In modern era of biotechnology the microbes have provided solutions to many of the human problems and necessities and thus serve as human and farmers friends The microbes have proved to be successful tools for the pest management Similarly there has been much advancement in the field of molecular biology where many more techniques have evolved which can be helpful in the field of pest management too Plant resistance development of transgenic plants and many more techniques are being considered the panacea to pest problems On the other hand there are wide spread concerns of the safety of these microbial and biotechnological interventions with nontarget organisms including humans While the world stands divided on the ethical issues of these approaches and the many safety concerns scientists believe that well thought of microbial and biotechnological interventions are probably the only safest ways possible for reducing pest attacks on crops This is useful read for postgraduate students and teachers plant protection practioners across the world and also useful for policy planners
