Molecular Mechanisms of Neuronal Responsiveness Yigal H. Ehrlich, Robert H. Lenox, Elizabeth Kornecki, William O. Berry, 2013-03-13 The interaction of neurotransmitters neuromodulators and neuroactive drugs with receptors localized at the cell surface initiates a chain of molecular events leading to integrated neuronal responses to the triggering stimuli Major advancements in the characterization and isolation of receptor molecules have answered many questions regarding the nature of the elements that determine the specificity in these interactions At the same time recent studies have provided evidence that delicate regulation by intracellular enzymatic systems determines the efficiency of the stimulus response coupling process mediates the interaction between receptors operates in feedback control mechanisms and transduces signals from the receptors to various effector sites in a highly coordinated fashion These studies are at the focus of the present volume which is an outcome of a symposium held at the University of Vermont College of Medicine on March 21-23 1986 in conjunction with the seventeenth annual meeting of the American Society for Neurochemistry The symposium has demonstrated clearly that the concerted efforts of investigators in neurophysiology biochemistry pharmacology cell biology molecular genetics neurology and psychiatry are required to achieve better understanding of the processes underlying neuronal responsiveness This volume includes contributions provided by prominent investigators in all these research areas We hope that the readers will find here a useful source of information and ideas for stimulating further studies which may serve to narrow the gap between basic neuroscience research and its clinical implications **The Pineal Gland** Russel J.

Parkinson's Disease Richard Nass, Serge Przedborski, 2011-04-28 Parkinson's disease is the second most prevalent neurodegenerative disease and is characterized by the irreversible loss of dopamine neurons Despite its high prevalence in society and many decades of research the origin of the pathogenesis and the molecular determinants involved in the disorder has remained elusive Confounding this issue is the lack of experimental models that completely recapitulate the disease state The identification of a number of genes thought to play a role in the cell death and development of both toxin and genetic models to explore the function of the genes both in unaffected and diseased cells are now providing new insights into the molecular basis of the neurodegeneration as well as therapeutic approaches In this reference we will describe the advances and the advantages that various invertebrates cell culture rodents and mammals provide in the identification of the molecular components and mechanisms involved in the cell death and outline the opportunities that these systems provide in drug discovery Comprehensive and critical assessment of the utility of various model systems to identify the molecular components and pathways involved in Parkinson's disease Describes the power of toxin and genetic models to identify novel therapeutic targets and compounds that can be used in PD Current overviews of current status of PD research and discovery from bench to bedside Provides novel insights and views on where the future of PD research may lead Provides a powerful teaching tool and template to explore the utility of model systems to identify molecular pathways molecular targets and therapeutics that are applicable to a variety of neurological diseases
