Platelet-Activating Factor and Related Lipid Mediators F. Snyder,2013-11-11 Platelet activating factor PAF is the commonly used name for a group of potent biologically active ether linked phospholipids the alkylacetylglycerophosphocholines Following the identification of the chemical structure of P AF in 1979 much progress has been made in our understanding of these phospholipid mediators This is particularly true from the points of view of their molecular structural requirements for expression of biological activity their biosynthesis and catabolism their diverse range of biological activities evidence for their specific receptors at the cell surface the development of specific antagonists for use in receptor studies and for testing as potential anti PAF drugs and implications about their involvement in health and disease Chapters in this book cover the current status of these general areas of PAF research Although an enormous amount of information has been published about this interesting new type of phospholipid mediators questions about their mechanism of action regulatory controls and the precise role and relative importance of P AF in specific diseases and physiological functions remain to be answered Since the 1979 discovery the PAF field has brought together scientists from a variety of different biomedical disciplines The diversity of scientists now in PAF research is very apparent from the number of P AF publications appearing in a wide array of scientific journals ranging from molecular biology to clinical medicine Publications related to PAF continue to increase at an amazingly rapid rate with the pace reminiscent of the period following the discovery of prostaglandins

Platelets, Thrombosis and the Vessel Wall Michael C Berndt, 2003-09-02 Platelets Thrombosis and the Vessel Wall aims to highlight the key areas of platelet function in the regulation of haemostasis and thrombosis and covers areas such as platelet production interaction of platelets with leucocytes mechanisms of cross talk between platelets leukocytes and endothelium The two major clinical causes of thrombosis are Current Aspects of Blood Coagulation, Fibrinolysis, and Platelets Ming-Ching Shen, Che-Ming Teng, Akikazu Takada, 2013-11-11 The first Sino Japanese symposium on Coagulation Fibrinolysis and Platelets originating from the Hamamatsu symposium held in early 1990 was held in Hanchow Mainland China in October 1990 During that meeting Taipei was selected as the next meeting place We took great pleasure in carrying out this noble endeavor and were honored to have Professor Stenflo Professor Hedner from Sweden Professor Aoki and many other distinguished scientists from Japan joining us on this Second Sino Japanese symposium Our only regret was that our friends from Mainland China did not attend The topics covered during the 3 day symposium included areas of both basic and clinical research The symposium has been an excellent opportunity for all the participants to exchange ideas and improve their expertise and at the same time to expand frontiers in the field of coagulation fibrinolysis and platelets The symposium was very successful both in terms of contributing greatly to raise the level of research and development in the field of thrombosis and hemostasis and in helping to promote international scientific cooperation and friendship We would like to express our appreciation to the members of our organizing and scientific committee for their devotion to this project We also wish to thank our National Science Council and Department of Health and the Asia and Pacific Council for Science and Technology as well as the many other sponsors for their financial support Without them this instructive and invaluable symposium and this proceedings would not have been possible

Platelets and Their Factors Franz von Bruchhausen, Ulrich Walter, 2012-12-06 Platelets play a fundamental life saving role in hemostasis and blood clotting at sites of vascular injury Unwanted platelet activation and arterial thrombus formation are however implicated in the onset of myocardial infarction stroke and other cardiovascular diseases Acceptance that platelets play a major role in the pathogenesis of atherosclerosis including coronary heart disease has revolutionized the pharmacological treatment of cardiovascular diseases and aspirin is now an essential antiplatelet drug and the golden standard for future developments Yet the search for better and perhaps safer antiplatelet drugs is one of the most active areas of investigation in both basic and clinical research Platelets especially human platelets have also emerged as one of the major models for the study of inter and intracellular signal transduction pathways Many biochemists cell biologists pharmacologists pathologists hematologists and cardiologists find platelets useful for studying processes such as adhesion inside out and outside in signalling through the plasma membrane channels calcium homeostasis protein kinases the network of intracellular signal transduction

cascades and the release of vasoactive substances The aim of the editors has been to compile chapters summarizing the current state of the art information on the biochemistry cell biology pharmacology and physiologic and pathophysiologic roles of human platelets We hope that this volume represents the major aspects of current platelet research although it is perhaps inevitable that certain areas are covered less thoroughly than others We would like to acknowledge the excellent help and support of the Springer Verlag staff in particular that of Ms Doris Walker **Drug Metabolism Reviews** ,1990
