Compiled to illustrate the recent history of Quantum Field Theory and its trends this collection of selected reprints by Jurg Frohlich a leading theoretician in the field is a comprehensive guide of the more mathematical aspects of the subject Results and methods of the past fifteen years are reviewed The analytical methods employed are non perturbative and for the larger part mathematically rigorous Most articles are review articles surveying certain important developments in quantum field theory and guiding the reader towards the original literature The volume begins with a comprehensive introduction by Jurg Frohlich The theory of phase transitions and continuous symmetry breaking is reviewed in the first section The second section discusses the non perturbative quantization of topological solitons The third section is devoted to the study of gauge fields A paper on the triviality of  $\phi^4$  theory in four and more dimensions is found in the fourth section while the fifth contains two articles on random geometry The sixth and final part addresses topics in low dimensional quantum field theory including braid statistics two dimensional conformal field theory and an application to condensed matter theory

**New Developments in Quantum Field Theory** Poul Henrik Damgaard, Jerzy Jurkiewicz, 2006-04-11

Quantum field theory is one of most central constructions in 20th century theoretical physics and it continues to develop rapidly in many different directions The aim of the workshop New Developments in Quantum Field Theory which was held in Zakopane Poland June 14-20 1997 was to capture a broad selection of the most recent advances in this field The conference was sponsored by the Scientific and Environmental Affairs Division of NATO as part of the Advanced Research Workshop series This book contains the proceedings of that meeting Major topics covered at the workshop include quantized theories of gravity string theory conformal field theory cosmology field theory approaches to critical phenomena and the renormalization group matrix models and field theory techniques applied to the theory of turbulence One common theme at the conference was the use of large N matrix models to obtain exact results in a variety of different disciplines For example it has been known for several years that by taking a suitable double scaling limit certain string theories or two dimensional quantum gravity coupled to matter can be re obtained from the large N expansion of matrix models There continues to be a large activity in this area of research which was well reflected by talks given at our workshop Remarkably large N matrix models have very recently just a few months before our meeting been shown to have yet another deep relation to string theory
