Hill, 2018-12-07 Speech and audio processing has undergone a revolution in preceding decades that has accelerated in the last few years generating game changing technologies such as truly successful speech recognition systems a goal that had remained out of reach until very recently This book gives the reader a comprehensive overview of such contemporary speech and audio processing techniques with an emphasis on practical implementations and illustrations using MATLAB code Core concepts are firstly covered giving an introduction to the physics of audio and vibration together with their representations

using complex numbers Z transforms and frequency analysis transforms such as the FFT Later chapters give a description of the human auditory system and the fundamentals of psychoacoustics Insights results and analyses given in these chapters are subsequently used as the basis of understanding of the middle section of the book covering wideband audio compression MP3 audio etc speech recognition and speech coding The final chapter covers musical synthesis and applications describing methods such as and giving MATLAB examples of AM FM and ring modulation techniques This chapter gives a final example of the use of time frequency modification to implement a so called phase vocoder for time stretching in MATLAB Features A comprehensive overview of contemporary speech and audio processing techniques from perceptual and physical acoustic models to a thorough background in relevant digital signal processing techniques together with an exploration of speech and audio applications A carefully paced progression of complexity of the described methods building in many cases from first principles Speech and wideband audio coding together with a description of associated standardised codecs e g MP3 AAC and GSM Speech recognition Feature extraction e g MFCC features Hidden Markov Models HMMs and deep learning techniques such as Long Short Time Memory LSTM methods Book and computer based problems at the end of each chapter Contains numerous real world examples backed up by many MATLAB functions and code

Speech Processing in the Auditory System Steven Greenberg, William A. Ainsworth, Richard R. Fay, 2006-05-09 Although speech is the primary behavioral medium by which humans communicate its auditory basis is poorly understood having profound implications on efforts to ameliorate the behavioral consequences of hearing impairment and on the development of robust algorithms for computer speech recognition In this volume the authors provide an up to date synthesis of recent research in the area of speech processing in the auditory system bringing together a diverse range of scientists to present the subject from an interdisciplinary perspective Of particular concern is the ability to understand speech in uncertain potentially adverse acoustic environments currently the bane of both hearing aid and speech recognition technology There is increasing evidence that the perceptual stability characteristic of speech understanding is due at least in part to elegant transformations of the acoustic signal performed by auditory mechanisms As a comprehensive review of speech s auditory basis this book will interest physiologists anatomists psychologists phoneticians computer scientists biomedical and electrical engineers and clinicians
