Real Time Computing Alexander D. Stoyenko, 2013-12-14 NATO's Division of Scientific and Environmental Affairs sponsored this Advanced Study Institute because it was felt to be timely to cover this important and challenging subject for the first time in the framework of NATO's ASI programme The significance of real time systems in everyone's life is rapidly growing The vast spectrum of these systems can be characterised by just a few examples of increasing complexity controllers in washing machines air traffic control systems control and safety systems of nuclear power plants and finally future military systems like the Strategic Defense Initiative SDI The importance of such systems for the well being of people requires considerable efforts in research and development of highly reliable real time systems Furthermore the competitiveness and prosperity of entire nations now depend on the early application and efficient utilisation of computer integrated manufacturing systems CIM of which real time systems are an essential and decisive part Owing to its key significance in computerised defence systems real time computing has also a special importance for the Alliance The early research and development activities in this field in the 1960s and 1970s aimed towards improving the then unsatisfactory software situation Thus the first high level real time languages were defined and developed RTL 2 Coral 66 Procol LTR and PEARL In close connection with these language developments and with the utilisation of special purpose process control peripherals the research on real time operating systems advanced considerably

Model-Based Engineering of Embedded Real-Time Systems Holger Giese, Gabor Karsai, Edward A. Lee, Bernhard Rumpe, Bernhard Schätz, 2010-10-09 The topic of Model Based Engineering of Real Time Embedded Systems brings together a challenging problem domain real time embedded systems and a solution domain model based engineering It is also at the forefront of integrated software and systems engineering as software in this problem domain is an essential tool for system implementation and integration Today real time embedded software plays a crucial role in most advanced technical systems such as airplanes mobile phones and cars and has become the main driver and catalyst for innovation Development evolution verification configuration and maintenance of embedded and distributed software nowadays

are often serious challenges as drastic increases in complexity can be observed in practice Model based engineering in general and model based software development in particular advocates the notion of using models throughout the development and life cycle of an engineered system Model based software engineering re forces this notion by promoting models not only as the tool of abstraction but also as the tool for veri cation implementation testing and maintenance The application of such model based engineering techniques to embedded real time systems appears to be a good candidate to tackle some of the problems arising in the problem domain

Embedded Software

Thomas A. Henzinger,Christoph M. Kirsch,2003-06-30 With the omnipresence of micro devices in our daily lives embedded software has gained tremendous importance in both science and industry This volume contains 34 invited papers from the First International Workshop on Embedded Systems They present latest research results from different areas of computer science that are traditionally distinct but relevant to embedded software development such as for example component based design functional programming real time Java resource and storage allocation verification Each paper focuses on one topic showing the inter relationship and application to the design and implementation of embedded software systems

Cooperative Environments for Distributed Systems Engineering Khalil Drira,Andrea Martelli,Thierry Villemur,2001-12-14 The engineering life cycle for complex systems design and development where partners are dispersed in different locations requires the set up of adequate and controlled processes involving many different disciplines The design integration and the final system physical functional integration and qualification imply a high degree of cross interaction among the partners The place technical information systems supporting the life cycle activities are specialized with respect to the needs of each actor in the process chain and are highly heterogeneous between them To globally innovate in place processes specialists must be able to work as a unique team in a virtual enterprise model To this aim it is necessary to make

interoperable the different technical information systems and to define co operative engineering processes which take into account distributed roles shared activities and distributed process controls In this frame an innovative study aimed at addressing this process with the goal of identifying proper solutions in terms of design implementation and deployment has been carried out with the support of the European Community and the participation of major industrial companies and research centers

Lectures on Embedded Systems Grzegorz Rozenberg,Frits W. Vaandrager,1998-10-14 This volume originates from the School on Embedded Systems held in Veldhoven The Netherlands in November 1996 as the first event organized by the European Educational Forum Besides thoroughly reviewed and revised chapters based on lectures given during the school additional papers have been solicited for inclusion in the present book in order to complete coverage of the relevant topics The authors adress professionals involved in the design and management of embedded systems in industry as well as researchers and students interested in a competent survey The book will convince the reader that many architectural and algorithmic problems in the area of embedded systems have well documented optimal or correct solutions notably in the fields of real time computing distributed computing and fault tolerant computing

Realtime Systems Nimal Nissanke,1997 Real Time computing is one of th most demanding and challenging areas in computing It is also of great importance since real time software is indispensable to all ultra reliable and safety critical applications The objective of this book is to provide an introduction to the whole area of real time computing Although it boundaries are bit well defined the body of knowledge relevant to the study of real time systems encompasses a whole range of topics There are issues such as clocks specification

design and modelling of real time systems which are exclusive to the study of real time systems There are also a number of fairly independent topics having applications outside real time systems but with a definite real time dimension The book supplies a framework for the study of real time systems facilitating a higher level of abstraction and a sharper focus on concepts and issues Invariably this framework relies on mathematics but the mathematics are explained and kept to the minimum Most chapters are self contained and each deals with a separate topic The exceptions are Chapters 2 4 since they contain notations and concepts used elsewhere The occasional cross reference between chapters are intended to underline the coherence of the material rather than the dependence of topics

Multi-Agent System Engineering Francisco J. Garijo, Magnus Boman, 2007-07-23 In the ten years since the first MAAMAW was held in 1989 at King's College Cambridge the field of Multi Agent Systems MAS has flourished It has attracted an increasing amount of theoretical and applied research During this decade important efforts have been made to establish the scientific and technical foundations of MAS MAAMAW publications are testimony to the progress achieved in key areas such as agent modelling and reasoning multi agent interaction and communication and multi agent organisation and social structure Research results have covered a wide range of inter related topics in each area including agent architectures reasoning models logics conflict resolution negotiation resource allocation load balancing learning social behaviour and interaction languages and protocols interagent and agent human communication social models agent roles norms and social laws and static and dynamic organisational structures The feasibility and the viability of the proposed models and techniques have been demonstrated through MAS applications in heterogeneous domains including electronic commerce co operative work telecommunications social and biological systems robotics office and business automation public administration social simulations and banking As the applicability of the technology became understood the multi agent paradigm has been progressively accepted by product managers and system developers giving rise to a considerable amount of business expectation from industry These expectations do not rest on the concept or metaphor of agent but on the development of MAS useful in an industrial setting with real time systems presenting the biggest challenge

Imprecise and Approximate Computation Swaminathan Natarajan, 2007-08-26 Real time systems are now used in a wide variety of applications Conventionally they were configured at design to perform a given set of tasks and could not readily adapt to dynamic situations The concept of imprecise and approximate computation has emerged as a promising approach to providing scheduling flexibility and enhanced dependability in dynamic real time systems The concept can be utilized in a wide variety of applications including signal processing machine vision databases networking etc For those who wish to build dynamic real time systems which must deal safely with resource unavailability while continuing to operate leading to situations where computations may not be carried through to completion the techniques of imprecise and approximate computation facilitate the generation of partial results that may enable the system to operate safely and avert catastrophe Audience Of special interest to researchers May be used
