Recent Advances In Solids Structures :

IUTAM Symposium on Recent Advances of Acoustic Waves in Solids Tsung-Tsong Wu, Chien-Ching Ma, 2010-09-08
Rapid growth of the mobile communication market has triggered extensive research on the bulk as well as surface acoustic wave devices in the last decade. Quite a few important results on the modeling and simulation of Film Bulk Acoustic Resonator FBAR and Layered SAW devices were reported recently. The other recent advance of acoustic waves in solids is the so called phononic crystals or phononic band gap materials. Analogous to the band gap of light in photonic crystals, acoustic waves in periodic elastic structures also exhibit band gap. Important applications of phononic band gap materials can potentially be found with creating a vibration free environment in microstructures and design of advanced acoustic frequency filter etc. In addition to the wave electronics and phononic crystals to facilitate the emerging needs in the quantitative nondestructive evaluation of materials, waves in anisotropic solids and or electro magneto interaction problems also regained much attention recently. Topics treated include Waves in piezoelectric crystals, Simulation of advanced BAW and SAW devices, Analysis of band gaps in phononic structures, Experimental investigation of phononic structures, Waves in multilayered media, Waves in anisotropic solids and or electro magneto interaction problems. Recent Advances in Porous Ceramics Uday M. Basheer Al-Naib,2018-09-19 Porous ceramics have recently gained growing importance in industry because of their many applications like filters absorbers dust collectors thermal insulation hot gas collectors dielectric resonators bioreactors bone replacement and automobile engine components Generally porous ceramics have good properties such as mechanical strength abrasion resistance and chemical and thermal stability These porous network ceramic structures also have relatively low density low mass and low thermal conductivity

Furthermore permeability is one of the most important properties of porous ceramics for different applications such as membranes because this property directly relates to the pressure drop during filtration Pore size control is one key factor in fabrication of porous ceramics The size of particles and their distribution of the raw materials manufacturing techniques types of binder used distribution of binder and sintering affect the final porosity and pore connectivity are important things that must be considered during the manufacturing of a porous ceramic body Therefore the development of porous ceramic research requires sufficient mechanical and chemical stability as well as permeability This book covers a wide range of topics such as porous ceramic structure and properties preparation simulation and fabrication sintering applications for bioceramics sensors magnetics and energy saving
