*Radiative Processes in High Energy Astrophysics* Gabriele Ghisellini, 2013-06-03 This book grew out of the author's notes from his course on Radiative Processes in High Energy Astrophysics The course provides fundamental definitions of radiative processes and serves as a brief introduction to Bremsstrahlung and black body emission relativistic beaming synchrotron emission and absorption Compton scattering synchrotron self Compton emission pair creation and emission The final chapter discusses the observed features of Active

Galactic Nuclei and their interpretation based on the radiative processes presented in the book Written in an informal style this book will guide students through their first encounter with high energy astrophysics Atomic Spectroscopy and Radiative Processes Egidio Landi Degl'Innocenti, 2014-06-24 This book describes the basic physical principles of atomic spectroscopy and the absorption and emission of radiation in astrophysical and laboratory plasmas It summarizes the basics of electromagnetism and thermodynamics and then describes in detail the theory of atomic spectra for complex atoms with emphasis on astrophysical applications Both equilibrium and non equilibrium phenomena in plasmas are considered The interaction between radiation and matter is described together with various types of radiation e g cyclotron synchrotron bremsstrahlung Compton The basic theory of polarization is explained as is the theory of radiative transfer for astrophysical applications Atomic Spectroscopy and Radiative Processes bridges the gap between basic books on atomic spectroscopy and the very specialized publications for the advanced researcher it will provide under and postgraduates with a clear in depth description of theoretical aspects supported by practical examples of applications An Introduction to Special Relativity for Radiation and Plasma Physics Greg Tallents, 2022-11-24 This textbook introduces the topic of special relativity with a particular emphasis upon light matter interaction and the production of light in plasma The physics of special relativity is intuitively developed and related to the radiative processes of light The book reviews the underlying theory of special relativity before extending the discussion to applications frequently encountered by postgraduates and researchers in astrophysics high power laser interactions and the users of specialized light sources such as synchrotrons and free electron lasers A highly pedagogical approach is adopted throughout and numerous exercises are included within each chapter to reinforce the presentation of key concepts and applications of the material **Radiation Processes in Astrophysics** Wallace H. Tucker, 1975 The purpose of this book is twofold to provide a brief simple introduction to the theory of radiation and its application in astrophysics and to serve as a reference manual for researchers The first part of the book consists of a discussion of the basic formulas and concepts that underlie the classical and quantum descriptions of radiation processes The rest of the book is concerned with applications The spirit of the discussion is to present simple derivations that will provide some insight into the basic physics involved and then to state the exact results in a form useful for applications The reader is referred to the original literature and to reviews for rigorous derivations The wide range of topics covered is illustrated by the following table of contents Basic Formulas for Classical Radiation Processes Basic Formulas for Quantum Radiation Processes Cyclotron and Synchrotron Radiation Electron Scattering Bremsstrahlung and Collision Losses Radiative Recombination The Photoelectric Effect and Emission and Absorption Lines Tools of Radio Astronomy Thomas L. Wilson, Kristen Rohlfs, Susanne Hüttemeister, 2013-12-05 This 6th edition of Tools of Radio Astronomy the most used introductory text in radio astronomy has been revised to reflect the current state of this important branch of astronomy This includes the use of satellites low radio frequencies the millimeter sub mm universe the Cosmic Microwave Background and

the increased importance of mm sub mm dust emission Several derivations and presentations of technical aspects of radio astronomy and receivers such as receiver noise the Hertz dipole and beam forming have been updated expanded re worked or complemented by alternative derivations These reflect advances in technology The wider bandwidths of the Jansky VLA and long wave arrays such as LOFAR and mm sub mm arrays such as ALMA required an expansion of the discussion of interferometers and aperture synthesis Developments in data reduction algorithms have been included As a result of the large amount of data collected in the past 20 years the discussion of solar system radio astronomy dust emission and radio supernovae has been revisited The chapters on spectral line emission have been updated to cover measurements of the neutral hydrogen radiation from the early universe as well as measurements with new facilities Similarly the discussion of molecules in interstellar space has been expanded to include the molecular and dust emission from protostars and very cold regions Several worked examples have been added in the areas of fundamental physics such as pulsars Both students and practicing astronomers will appreciate this new up to date edition of Tools of Radio Astronomy

**High Energy Radiation from Black Holes** Charles Dermer, Govind Menon, 2009-10-11 Beginning with Einstein's special and general theories of relativity the authors give a detailed mathematical description of fundamental astrophysical radiation processes including Compton scattering of electrons and photons synchrotron radiation of particles in magnetic fields and much more

Fundamentals of Astrophysical Fluid Dynamics Shoji Kato, Jun Fukue, 2020-06-19 This book offers an overview of the fundamental dynamical processes which are necessary to understand astrophysical phenomena from the viewpoint of hydrodynamics magnetohydrodynamics and radiation hydrodynamics The book consists of three parts The first discusses the fundamentals of hydrodynamics necessary to understand the dynamics of astrophysical objects such as stars interstellar gases and accretion disks The second part reviews the interactions between gases and magnetic fields on fluid motions the magnetohydrodynamics highlighting the important role of magnetic fields in dynamical phenomena under astrophysical environments The third part focuses on radiation hydrodynamics introducing the hydrodynamic phenomena characterized by the coupling of radiation and gas motions and further on relativistic radiation hydrodynamics Intended as a pedagogical introduction for advanced undergraduate and graduate students it also provides comprehensive coverage of the fundamentals of astrophysical fluid dynamics making it an effective resource not only for graduate courses but also for beginners wanting to learn about hydrodynamics magnetohydrodynamics and radiation hydrodynamics in astrophysics independently

**Introduction to Stellar Structure** Walter J. Maciel, 2015-09-16 This book provides a comprehensive overview of stellar structure evolution and basic stellar properties It includes integrated problems within the chapters with worked solutions In the first part of this book the author presents the basic properties of the stellar interior and describes them

thoroughly along with deriving the main stellar structure equations of temperature density pressure and luminosity among others The process and application of solving these equations is explained as well as linking these results with actual observations The second part of the text describes what happens to a star over time and how to determine this by solving the same equations at different points during a star's lifetime The fate of various stars is quite different depending on their masses and this is described in the final parts of the book This text can be used for an upper level undergraduate course or an introductory graduate course on stellar physics

*Tools of Radio Astronomy* Kristen Rohlfs, T. L. Wilson, 2013-03-14

Progress in the fields of science and technology is again the reason for updating this text most changes occur in Chaps 4 7 8 and 14 in the others we have made a number of minor improvements In Chap 4 Signal Processing and Receivers we have shortened the presentation of maser and parametric amplifier front ends which are no longer commonly used as microwave receivers in radio astronomy Instead we have expanded the presentation of cooled transistor and superconducting front ends and we have added a short section on coherent multi beam receiver systems The chapter titled Observational Methods now appears as Chap 7 and mainly addresses single dish observations Chapter 8 now concerns Interferometers and Aperture Synthesis Aperture synthesis has become the single important imaging technique in observational astronomy and its use most has spread from the radio frequency range into other wavelength bands providing the only general method available for obtaining images of extremely high resolution and quality The discussion of the foundations for aperture synthesis therefore have been extended and hopefully improved Both the hardware and the software instrumentation is now collected in this chapter

*Tools of Radio Astronomy* T. L. Wilson, Kristen Rohlfs, Susanne Hüttemeister, 2008-11-14

Four significant factors have led us to update this text The first is the breathtaking progress in technology especially in receiver and digital techniques The second is the advance of radio astronomy to shorter wavelengths and the increased availability of astronomical satellites The third is a need to reorganize some of the chapters in order to separate the basic theory that seldom changes from practical aspects that change often Finally it is our desire to enhance the text by including problem sets for each chapter In view of this ambitious plan we have expanded the number of authors In the reorganization of this edition we have divided Chap 4 of the 4th edition into two Chaps 4 and 5 The first remains Chap 4 with a slightly different title Signal Processing and Receivers Theory This was expanded to include digital processing and components including samplers and digitizers In Chap 5 Practical Receiver Systems we have relegated the presentations of maser and parametric amplifier front ends which are no longer commonly used as microwave receivers in radio astronomy to a short section on historical developments and We have retained and improved the presentations of current state of the art devices cooled transistor and superconducting front ends We have also included descriptions of local oscillators and phase lock loops Chapters 5 and 6 in the 4th edition has now become Chap 6 Fundamentals of Antenna Theory and Chap
