Steen, 2012-12-06 Mathematics today is approaching a state of crisis As the demands of science and society for mathematical literacy increase the percentage of American college students intending to major in mathematics plummets and achievement scores of entering college students continue their unremitting decline As research in core mathematics reaches unprecedented heights of power and sophistication the growth of diverse applied special ties threatens to fragment mathematics into distinct and frequently hostile mathematical sciences These crises in mathematics presage difficulties for science and engineering and alarms are beginning to sound in the scientific and even in the political communities Citing a trend towards virtual scientific and technological illiteracy and a shrinking of our national commitment to excellence in science mathematics and technology a recent study conducted for the President by the U S National Science Foundation and Department of Education warns of serious impending shortcomings in public understanding of science Today people in a wide range of non scientific professions must have a greater understanding of technology than at any time in our history Yet our educational system does not now provide such understanding The study goes on to conclude that present trends pose great risk of manpower shortages in the mathematical and engineering sciences The pool

from which our future scientific and engineering personnel can be drawn is in danger of becoming smaller even as the need for such personnel is increasing It is time to take a serious look at mathematics tomorrow **Math through the Ages: A Gentle History for Teachers and Others Expanded Second Edition** William P. (Education) in the Information Age Stacy A. Costa,Marcel Danesi,Dragana Martinovic,2020-12-10 This book brings together ideas from experts in cognitive science mathematics and mathematics education to discuss these issues and to present research on how mathematics and its learning and teaching are evolving in the Information Age Given the ever broadening trends in Artificial Intelligence and the processing of information generally the aim is to assess their implications for how math is evolving and how math should now be taught to a generation that has been reared in the Information Age It will also look at the ever spreading assumption that human intelligence may not be unique an idea that dovetails with current philosophies of mind such as posthumanism and transhumanism The role of technology in human evolution has become critical in the contemporary world Therefore a subgoal of this book is to illuminate how humans now use their sophisticated technologies to chart cognitive and social progress Given the interdisciplinary nature of the chapters this will be of interest to all kinds of readers from mathematicians themselves working increasingly with computer scientists to cognitive scientists who carry out research on mathematics cognition and teachers of mathematics in a classroom *European Traditions in*
