

Types of Radionuclide Generators

1. Technetium Generators: Technetium-99m ($Tc-99m$) generators are the most widely utilized radionuclide generators in nuclear medicine.

Production: $Tc-99m$ is produced from the decay of its parent isotope, molybdenum-99 ($Mo-99$), which has a longer half-life.

Importance: $Tc-99m$ is a versatile radioisotope used in various diagnostic imaging procedures, including myocardial perfusion imaging, bone scans, and imaging of the liver, kidneys, and thyroid.

Advantages: Technetium generators provide a convenient and cost-effective method for producing $Tc-99m$ on-site, allowing for on-demand availability of this crucial radioisotope for medical imaging studies.

Schubiger, Gerrit Westera, 2012-12-06 This book is a compilation of the invited papers which were presented at the Fourth European Symposium on Radiopharmacy and Radiopharmaceuticals which was held in Baden Switz land 1 4 May 1991 The First and Third Symposia on Radiopharmacy and Radiopharmaceuticals Elsinore Denmark 1983 1987 concentrated on the safety and efficacy of radiopharmaceuticals whereas this Fourth Symposium to some extent followed up the subject of the Second Symposium Cambridge UK 1985 recent developments in radiopharmacy and current research on radiopharmaceuticals The symposium was organized by the Radiopharmacy Group of the Swiss Society of Medical Radiology Section Nuclear Medicine under the auspices of the task group on radiopharmaceu cals of the European Association of Nuclear Medicine EANM The organizing committee consisted of the cochairmen Drs P A Schubiger Paul Scherrer Institute PSI Villigen and G Westera University Hospital ZiJrich and the members H F Beer P Bl iuenstein P Hasler all PSI and H M icke Cantonal Hospital Basel The subjects of this Symposium ranged from isotope production to clinical testing of radioph maceuticals including the organisational prerequisites In addition the development of new radiopharmaceuticals and of PET radiopharmacy and the concomittant ongoing evolution of regulatory guidelines by national various European countries USA and international EC authorities induced us to honor the vivid interest in this subject and to make it an important part of this symposium **The Development of New Radionuclide Generator Systems for Nuclear Medicine Applications**, 1991

Radioisotope generator systems have traditionally played a central role in nuclear medicine in providing radioisotopes for both research and clinical applications In this paper the development of several tungsten 188 rhenium 188 prototype generators which provide rhenium 188 for radioimmunotherapy RAIT is discussed The authors have recently demonstrated that carrier free iridium 194 can be obtained from the activated carbon system from decay of reactor produced osmium 194 for potential RAIT applications Instrumentation advances such as the new generation of high count rate fast gamma camera systems for first pass technology require the availability of generator produced ultra short lived radioisotopes for radionuclide angiography RNA The activated carbon generator is an efficient system to obtain ultra short lived iridium 191 m from osmium 191 for RNA In addition the growing number of PET centers has stimulated research in generators which provide positron emitting radioisotopes Copper 62 obtained from the zinc 62 generator is currently used for PET evaluation of organ perfusion The availability of the parent radioisotopes the fabrication and use of these generators and the practical factors for use of these systems in the radiopharmacy are discussed 74 refs 6 figs 5 tabs Energy Research Abstracts

Radioactive Isotopes in Clinical Medicine and Research Xxiii Helmar Bergmann, Horst Köhn, Helmut Sinzinger,

Current Catalog National Library of Medicine (U.S.), New Radionuclide Generator Systems for Use in Nuclear

Medicine, 1979 A current emphasis in nuclear medicine is to better match the physical lifetime of the radionuclides used in vivo for diagnosis and treatment to the biological lifetime of the diagnostic procedure or to minimize radiation dose to areas other than those to be treated In many cases the biological lifetime is on the order of minutes Since the direct production of radionuclides with half lives of minutes requires the user to be near a suitable reactor or accelerator this study was undertaken to produce short lived radionuclides indirectly If a long lived radionuclide decays into a short lived radionuclide quick separation of the daughter activity from the parent enables the user to have a short lived daughter while freeing him

from the constraint of proximity to a cyclotron Systems where a short lived daughter is separated from a long lived parent are called radionuclide generators Two generator systems were developed for use in nuclear medicine one in diagnostic work and the other for therapeutic work The yield and breakthrough characteristics were within the limits required to minimize unnecessary radiation exposure in patients Two parent radionuclides were produced using sup 4 He beams available from medium energy cyclotrons The yield was high enough to produce generators that would be useful in clinical applications
